Style & Layout in the web: CSS and Bootstrap

Ambient intelligence: technology and design

Fulvio Corno

Politecnico di Torino, 2014/2015

Goal

- Styling web content
- Advanced layout in web pages
- Responsive layouts
- Libraries

Summary

- CSS – Cascading Style Sheets
- The Bootstrap framework

Style & Layout in the web

CSS – CASCADING STYLE SHEETS

Cascading Style Sheets

- CSS: Cascading Style Sheet
- CSS 1: W3C recommendation (17 Dec 1996)
- **CSS 2.1: W3C Recommendation (7 June 2011)**
- CSS 3: Working Draft
- Resources:
 - CSS 2.1 standard, <http://www.w3.org/TR/CSS21/>
 - W3C CSS Home: <http://www.w3.org/Style/CSS/>
 - W3C CSS Tutorial, <http://www.w3.org/Style/Examples/011/firstcss>

CSS Syntax

- CSS is based on rules
- A rule is a statement about one stylistic aspect of one or more HTML elements
- A style sheet is a set of one or more rules that apply to an HTML document

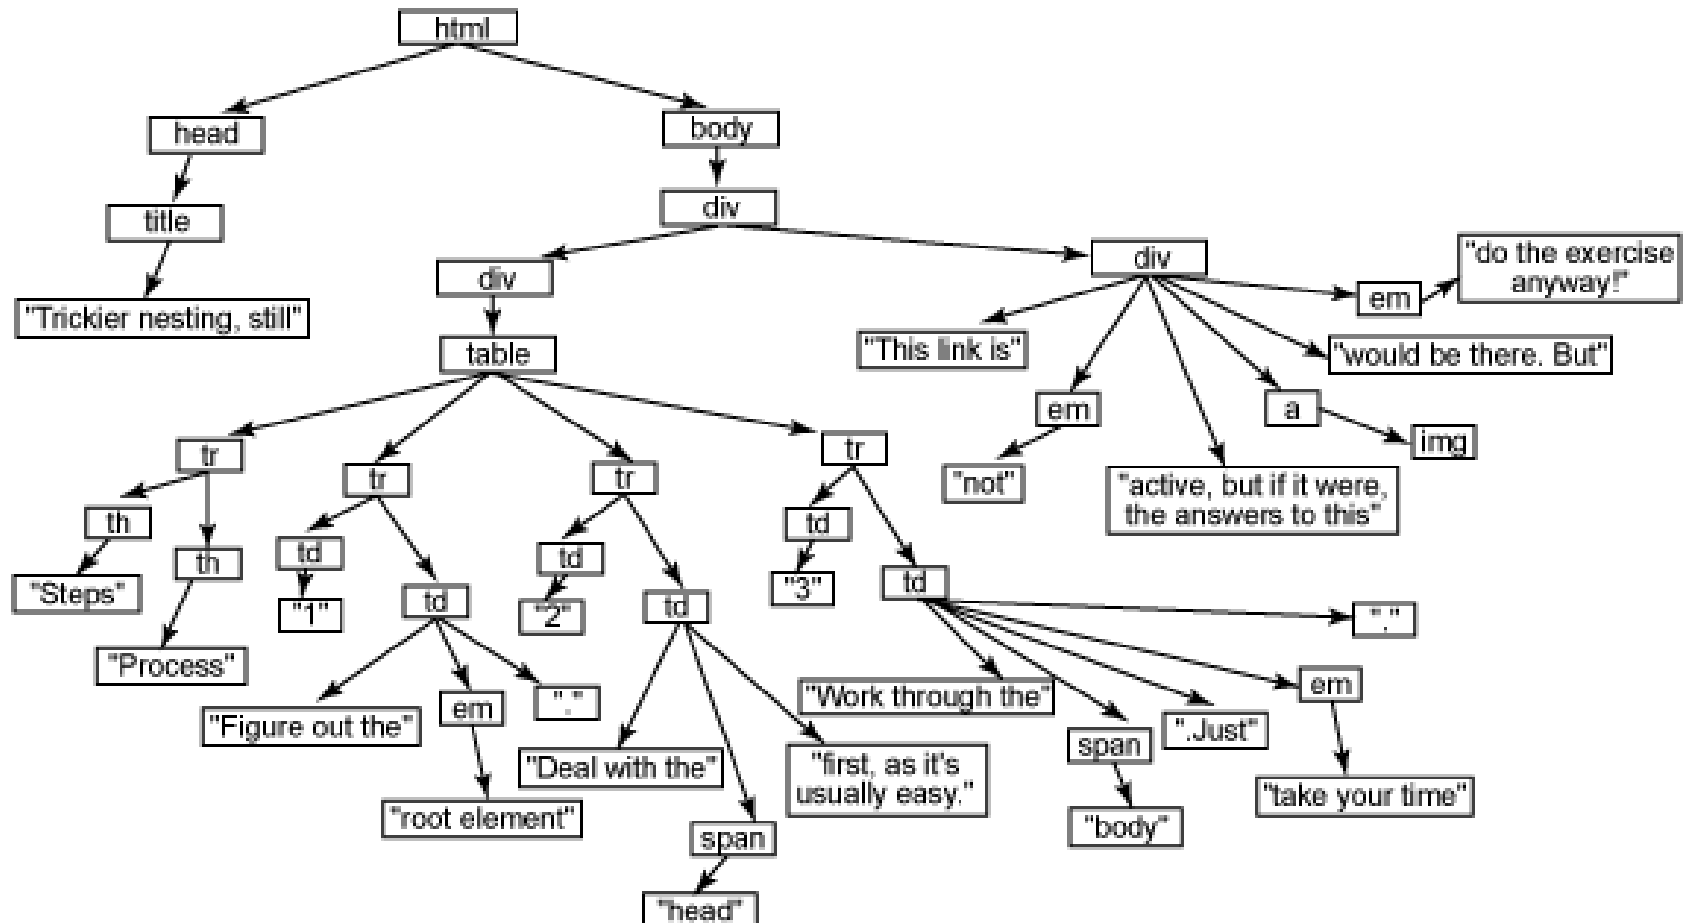

Tree structure

- HTML documents are trees

Tree structure

- HTML documents are trees

Tree structure and inheritance

- XHTML documents are trees
- Styles are inherited along trees

- When two rules are in conflict the most specific wins
- Example

– body {color: green}

– h1 {color: red}

Cascading Style Sheets

- The term “cascading” means that a document can include more than one style sheet
- In this case, visualization follows **priority** rules

External style

- Link to an external style sheet using the `<link>` element

```
h1 { font-size:17px;
      font-family:verdana; color:green; }
h2 { font-size:18px;
      font-family:arial; color:red; }
```

style.css

```
<head>
<link rel=stylesheet type="text/css"
      href="style.css">
</head>
<body>
<h1>Green text on verdana 17 pixel font</h1>
<h2>Red text on arial a 18 pixel font</h2>
</body>
```

External style

- Alternative method
- @import directive in the <style> element

```
<head>
  <style>
    @import url(style.css);
  </style>
</head>
<body>
  ...
</body>
```

Internal style

- `<style>` element inside the document header

```
<head>
<style type="text/css">
h1 { font-size:17px; font-family:verdana;
color:green; }
h2 { font-size:18px; font-family:arial;
color:red; }
</style>
</head>
```

Inline style

- `<style>` attribute within an XHTML element

```
<h1 style="font-size:17px;  
    font-family:verdana; color:green; "> Green text  
on verdana 17 pixel font </h1>
```

CSS properties

- <http://www.w3schools.com/cssref/>

CSS Property Groups

- [Color](#)
- [Background and Borders](#)
- [Basic Box](#)
- [Flexible Box](#)
- [Text](#)
- [Text Decoration](#)
- [Fonts](#)
- [Writing Modes](#)
- [Table](#)
- [Lists and Cour](#)
- [Animation](#)
- [Transform](#)
- [Transition](#)
- [Basic User Int](#)
- [Multi-column](#)

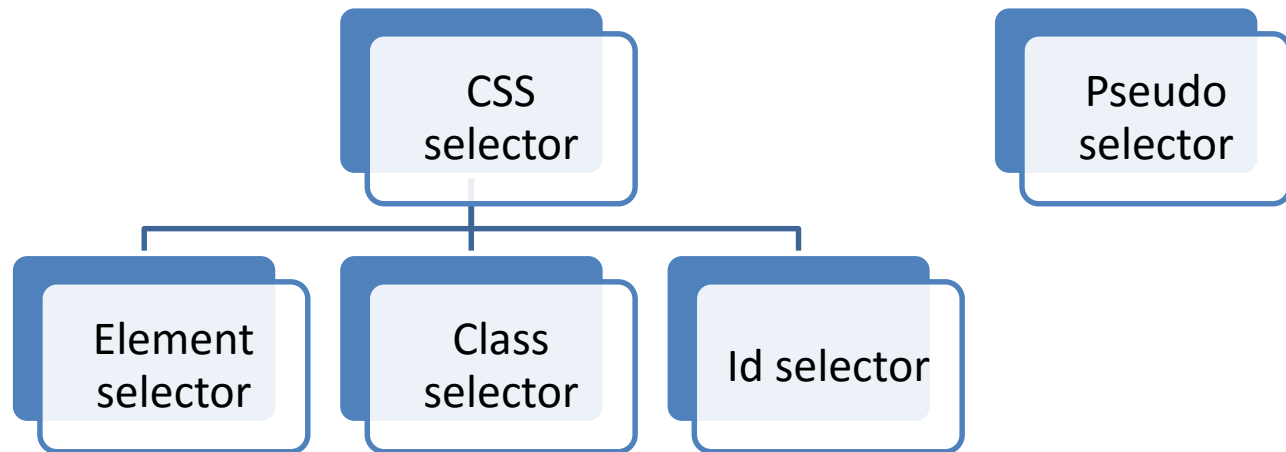

Color Properties

Property	Description	CSS
color	Sets the color of text	1
opacity	Sets the opacity level for an element	3

Default value:	<i>not specified</i>
Inherited:	yes
Animatable:	yes. Read about animatable
Version:	CSS1
JavaScript syntax:	<code>object.style.color="#0000FF"</code>

CSS selectors

- Three types of selectors plus “pseudo-selectors”

Main Selectors

Selector	E	.cc	#uu
HTML	<E>	<E class="cc">	<E id="uu">

Pattern	Meaning
*	Matches any element.
E	Matches any E element (i.e., an element of type E).
E F	Matches any F element that is a descendant of an E element.
E > F	Matches any F element that is a child of an element E.
E:first-child	Matches element E when E is the first child of its parent.
E:link E:visited	Matches element E if E is the source anchor of a hyperlink of which the target is not yet visited (:link) or already visited (:visited).
E:active E:hover E:focus	Matches E during certain user actions.
E:lang(c)	Matches element of type E if it is in (human) language c (the document language specifies how language is determined).
E + F	Matches any F element immediately preceded by a sibling element E.
E[foo]	Matches any E element with the "foo" attribute set (whatever the value).
E[foo="warning"]	Matches any E element whose "foo" attribute value is exactly equal to "warning".
E[foo~="warning"]	Matches any E element whose "foo" attribute value is a list of space-separated values, one of which is exactly equal to "warning".
E[lang = "en"]	Matches any E element whose "lang" attribute has a hyphen-separated list of values beginning (from the left) with "en".
DIV.warning	<i>Language specific.</i> (In HTML, the same as DIV[class~="warning"].)
E#myid	Matches any E element with ID equal to "myid"

2014/2015

Ambient intelligence, technology and design

<http://www.w3.org/TR/css-2010/#selectors>

Pseudo class selector

- Used to style an element based on something other than the structure of the document
 - E.g., the state of a form element or link

```
/* makes all unvisited links blue */  
a:link {color:blue;}  
/* makes all visited links green */  
a:visited {color:green;}  
/* makes links red when hovered or activated */  
a:hover, a:active {color:red;}  
/* makes table rows red when hovered over */  
tr:hover {background-color: red;}  
/* makes input elements yellow when focus is applied */  
input:focus {background-color:yellow;}
```

Meaningful XHTML

- Meaningful elements
 - h1, h2, ...
 - ul, ol, and dl
 - strong and em
 - blockquote and cite
 - abbr, acronym, and code
 - fieldset, legend, and label
 - caption, thead, tbody, and tfoot
 - HTML5 adds many new “semantic” elements
- `id` and `class` names
 - Allow to give extra meaning
- `div` and `span`
 - Add structure to document

DIV element

- Stands for “division”
- Used to group block-level elements
 - Provides a way of dividing a document into meaningful areas
- Use only if necessary and not redundant

```
<div id="mainNav">  
  <ul>  
    <li>Home</li>  
    <li>About Us</li>  
    <li>Contact</li>  
  </ul>  
</div>
```

```
<ul id="mainNav">  
  <li>Home</li>  
  <li>About Us</li>  
  <li>Contact</li>  
</ul>
```

SPAN element

- Used to group or identify inline elements

```
<h2>Where's Durstan?</h2>
<p>Published on
    <span class="date">March 22nd, 2005</span>
by <span class="author">Andy Budd</span></p>
```

The box model

- One of the cornerstones of CSS
- Dictates how elements are displayed and, to a certain extent, how they interact with each other
- Every element on the page is considered to be a rectangular box

THE CSS BOX MODEL HIERARCHY

The box model

- Content
 - The content of the box, where text and images appear
- Padding
 - Clears an area around the content
 - The padding is affected by the background color of the box
- Border
 - A border that goes around the padding and content
 - The border is affected by the background color of the box
- Margin
 - Clears an area around the border
 - The margin does not have a background color, it is completely transparent

Example

- Padding, borders, and margins are optional and default to zero

```
#myBox {  
  margin: 10px;  
  padding: 5px;  
  width: 70px;  
}
```

Positioning schemes

- Three basic positioning schemes in CSS
 - Normal flow
 - Floats
 - Absolute positioning
- Unless specified, all boxes start life being positioned in the normal flow
 - The position of an element's box in the normal flow will be dictated by that element's position in the (X)HTML

Normal flow

- **Block-level** boxes will appear vertically one after the other

```
<div> ... </div>
```

- The vertical distance between boxes is calculated by the boxes' vertical margins

- **Inline** boxes are laid out in a line horizontally

```
<span> ... </span>
```

- Their horizontal spacing can be adjusted using horizontal padding, borders, and margins
- Vertical padding, borders, and margins will have no effect on the height of an inline box

Display property

- Allows to control element visualization (block or inline)
- Changing an inline element to a block element, or vice versa, can be useful for making the page look a specific way
- Example
 - W3Schools.com
 - http://www.w3schools.com/Css/css_display_visibility.asp

```
li {display:inline;}
```

```
span {display:block;}
```

Box Positioning

- A block can be positioned in different ways to which correspond different positioning schemes
 - **Static:** normal block
 - **Relative:** the offset values are relative to the block position in the normal flow. If a relative block B follows a relative block A, the offset is respect to the position of A without the offset
 - **Absolute:** the box position is determined by the top, left, right, bottom properties and is relative to the containing block
 - **Fixed:** the box is fixed with respect to some reference (the viewport as an example)

Examples

- W3Schools.com
 - http://www.w3schools.com/Css/css_positioning.asp

The main problem people have with positioning is remembering which type of positioning is which. Relative positioning is “relative” to the element’s initial position in the flow of the document, whereas absolute positioning is “relative” to nearest positioned ancestor or, if one doesn’t exist, the initial container block.

A. Budd, C. Moll, S. Collison,
“CSS Mastery: Advanced Web Standards
Solutions”, FriendsOfED, 2006

Floating

- A floated box can either be shifted to the left or the right until its outer edge touches the edge of its containing box, or another floated box
- Often used for images and when working with layouts
 - Example
 - http://www.w3schools.com/Css/css_float.asp

```
img
{
float:right;
}
```

Floating

- Floated boxes aren't in the normal flow of the document, so block boxes in the regular flow of the document behave as if the floated box wasn't there

No boxes floated

Box 1 floated right

Floating

- If all three boxes are floated left
 - Box 1 is shifted left until it touches its containing box
 - Other two boxes are shifted left until they touch the preceding floated box

Box 1 floated left

All three boxes floated left

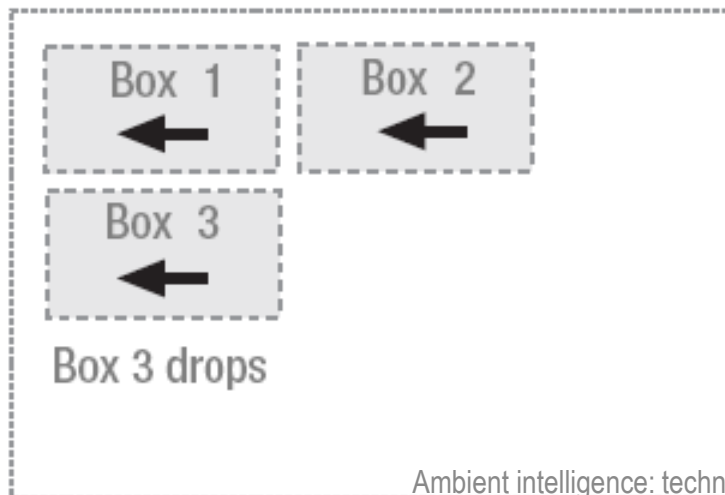

Examples/chapter03/floating-boxes.htm

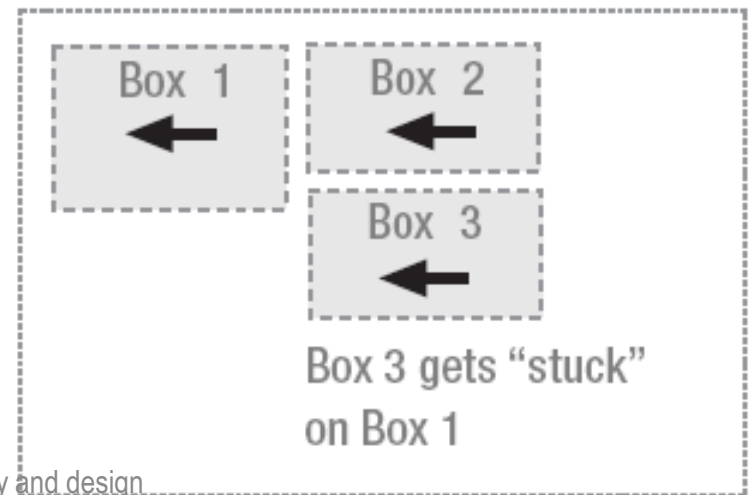

Floating

- If the containing block is too narrow for all of the floated elements to fit horizontally
 - The remaining floats will drop down until there is sufficient space
 - If the floated elements have different heights, it is possible for floats to get “stuck” on other

Not enough horizontal space

Different height boxes

Line boxes and clearing

- To stop line boxes flowing around the outside of a floated box, you need to apply a clear to that box
 - The clear property can be left, right, both, or none, and indicates which side of the box should not be next to a floated box

```
p { clear: left }
```

Image floated left

Second paragraph cleared

Style & Layout in the web

THE BOOTSTRAP FRAMEWORK

Bootstrap

- Open Source CSS (and Javascript) framework
- Allows applying “modern” styles
 - Sensible and nice-looking defaults
 - Easy to apply custom themes
- Takes care of cross-browser issues
- Simplified layout model

- Developed by Twitter
 - <http://getbootstrap.com/>

Bootstrap philosophy

- Based on CCS classes
- Each class applies one “effect”
- Various classes may be combined in the same element
- Wide range of “standard” classes
- Wide range of additional “components”
 - Ready-to use interactive elements or groups of elements
- Mobile-first
 - Responsive

Using Bootstrap

```
<!-- Latest compiled and minified CSS -->
<link rel="stylesheet" href="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.4
/css/bootstrap.min.css">

<!-- Optional theme -->
<link rel="stylesheet" href="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.4/css/bootstrap-
theme.min.css">

<!-- Latest compiled and minified JavaScript -->
<script src="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.4/js/bootstrap.min.js"></script>
```

- 3 files
 - Bootstrap
 - Theme
 - Javascript support
- Or download locally

Page structure

- Start with **Basic template**
 - <http://getbootstrap.com/getting-started/#template>
- Or, choose from published **Examples**
 - <http://getbootstrap.com/getting-started/#examples>
- Remember to include your page content in a `<div class="container">`
