Web Architecture

Layers, Languages, Protocols

Fulvio Corno

Luigi De Russis

Enrico Masala
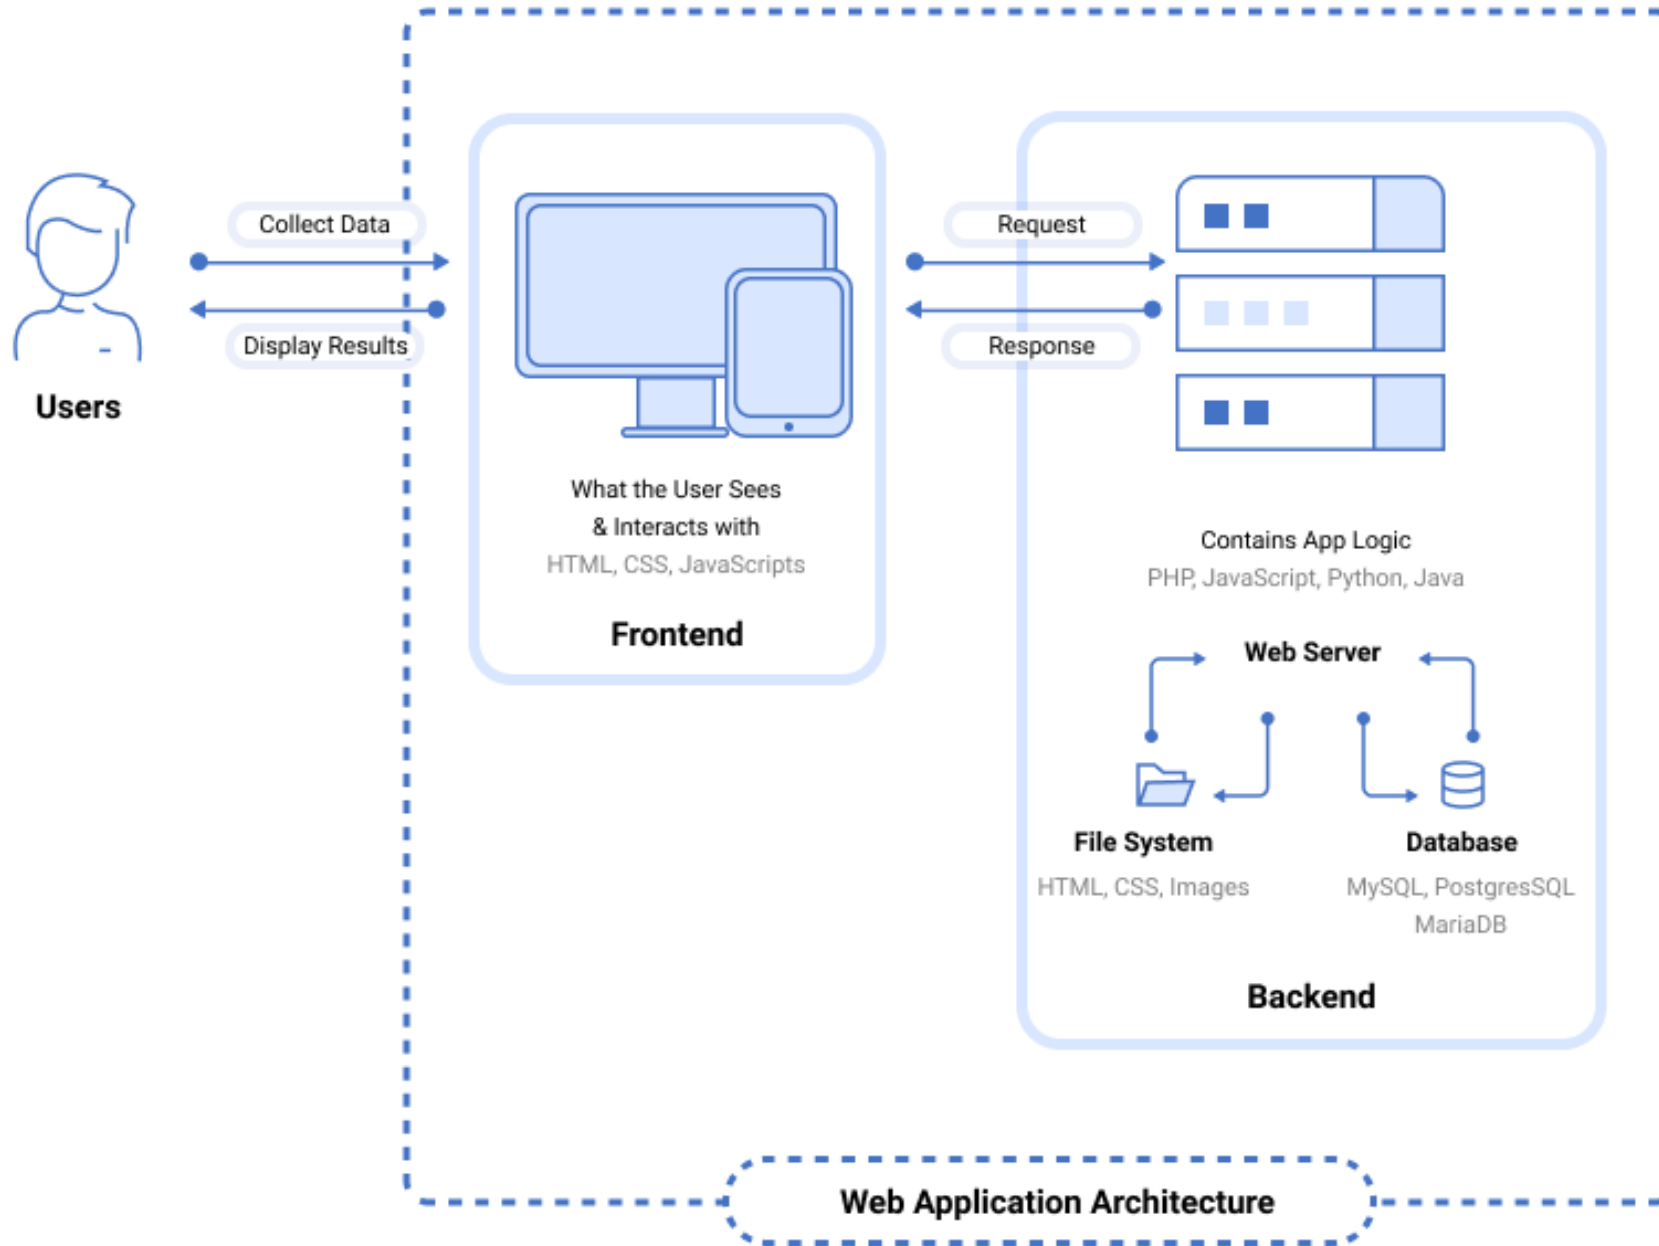

Goal

- Understand what is the Web and its architecture
  - main (logical) components
  - main network protocols
  - existing architectural patterns and languages
- Know the interaction and communication across components
- Learn the basics of how a browser works

- *NOTE: All the topics mentioned here will be presented in more details in the next lectures*
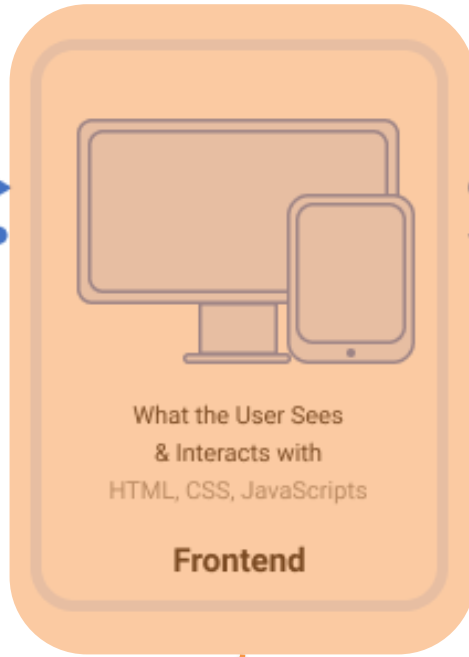

Web Application Architecture

Browsers

HTML 5, CSS, JavaScript, DOM, Events

Collect Data

MariaDB

Backend

Web Application Architecture

Browser

Browser

The HTML file might link to other **resources** (images, videos, ...)
as well as **JavaScript** and **CSS** files,
which the browser then also loads

These are stored or generated by a **server**

5

Quick Introduction to HTML

`https://developer.mozilla.org/docs/Learn/HTML/Introduction_to_HTML`

Browser

Browser

View page content

Interact with page elements (forms, buttons, links, …)

Navigate to other pages
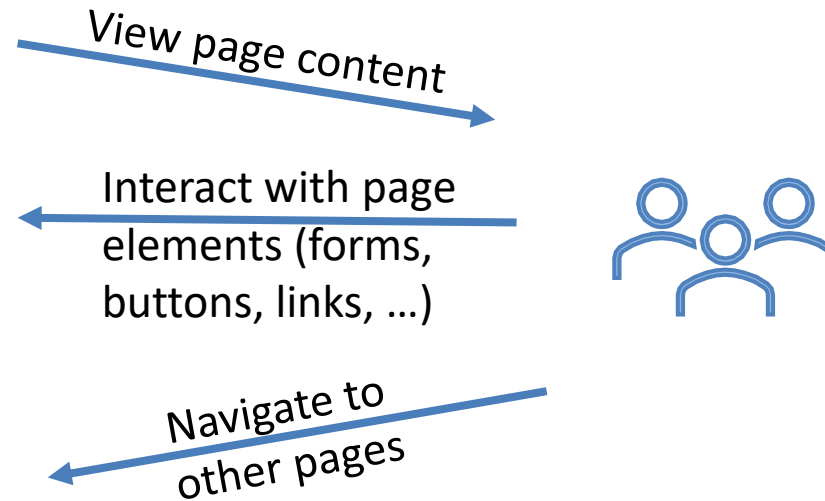

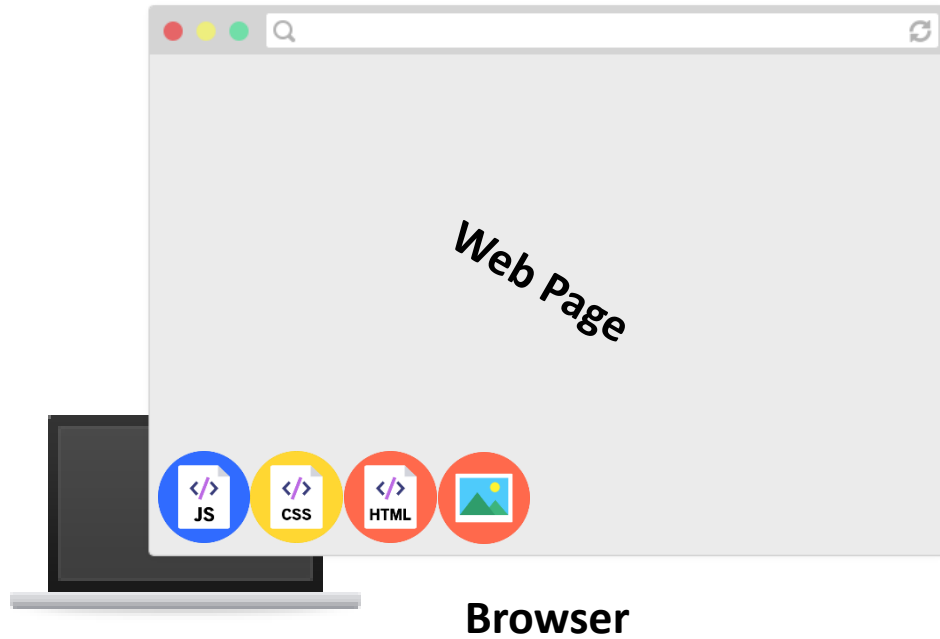

The content of the web page is described by HTML+CSS.

Clicking on a link brings the user to a **new page**.
Interacting with other elements may generate *Events* inside the browser.
Such Events are "captured" by JavaScript and may **update the page content**.

Conceptual Browser Architecture (from 10,000 feet)
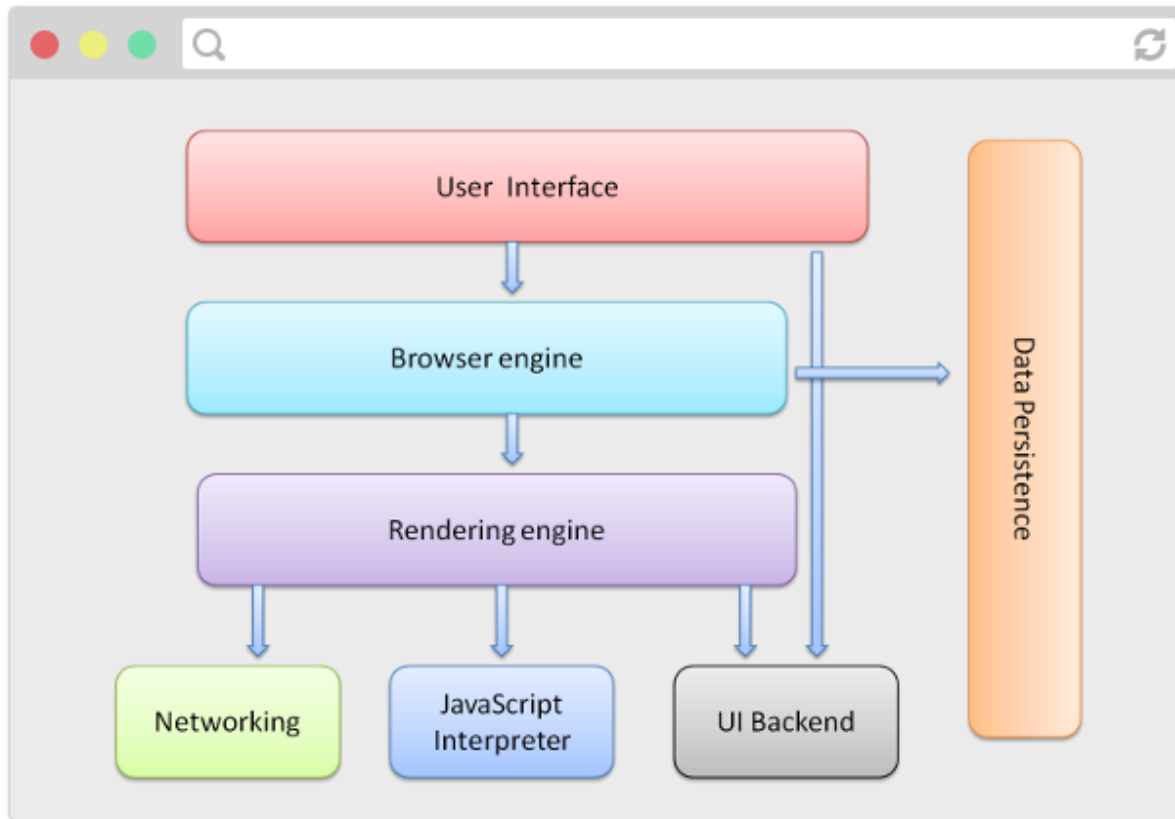

- **User Interface**: the address bar, back/forward button, bookmarking menu, etc. Every part of the browser display except the window where you see the requested page
- The **Browser Engine** marshals actions between the UI and the rendering engine
- **Rendering Engine:** responsible for displaying the requested content. For example, if the requested content is HTML, the rendering engine parses HTML and CSS, and displays the parsed content on the screen
- **Networking**: for network calls such as HTTP requests, using different implementations for different platform behind a platform-independent interface
- **UI Backend**: used for drawing basic widgets like combo boxes and windows. This backend exposes a generic interface that is not platform specific. Underneath it uses operating system user interface methods
- **JavaScript Interpreter:** used to parse and execute JavaScript code
- **Data Persistence:** a persistence layer. The browser may need to save all sorts of data locally, such as cookies. Browsers also support storage mechanisms such as LocalStorage, IndexedDB, WebSQL and FileSystem

Browser Development tools
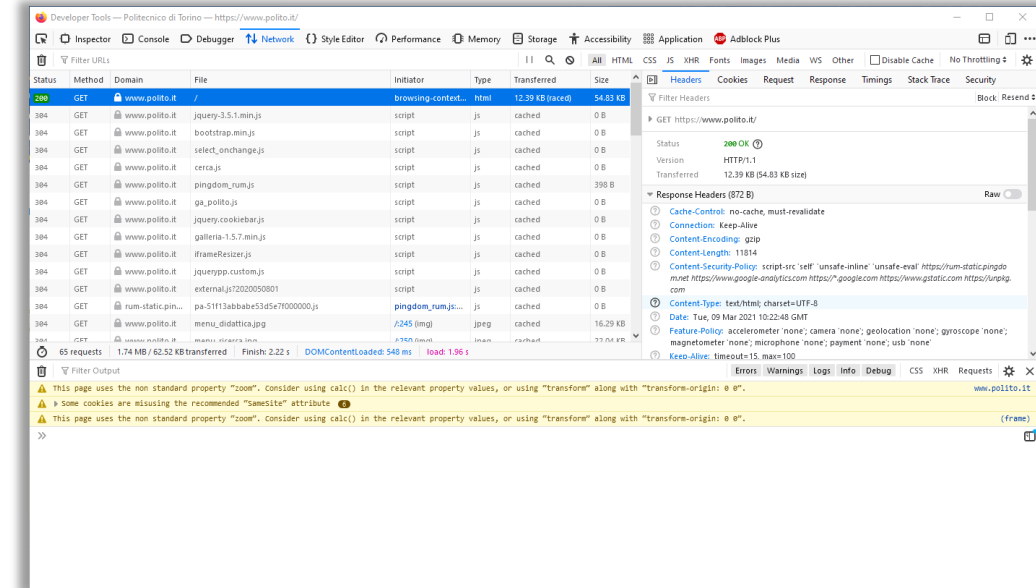

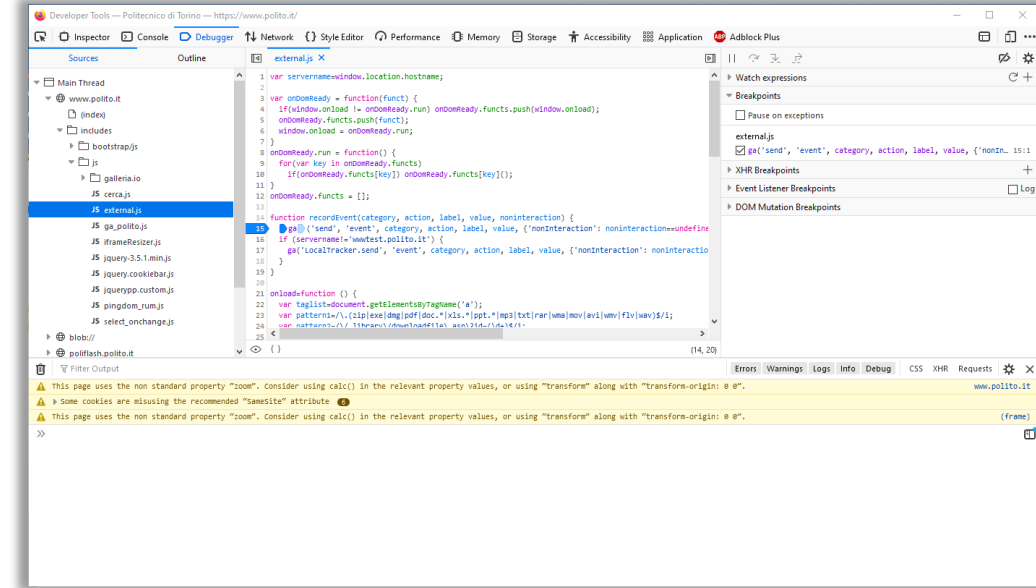

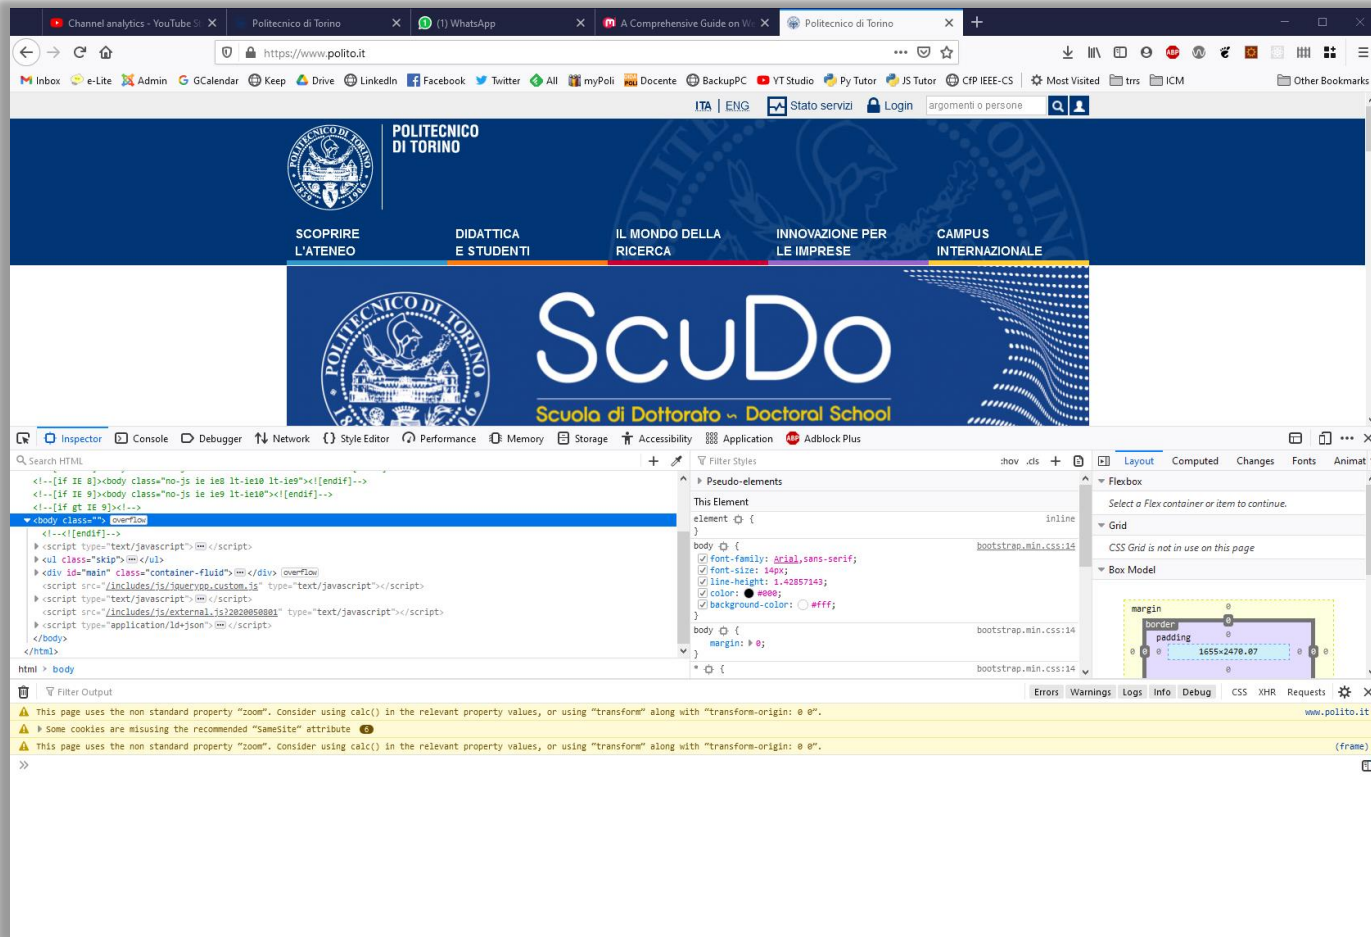

Document Object Model (DOM)

"The W3C **Document Object Model** (DOM) is a *platform and language-neutral interface* that allows programs and scripts to dynamically *access* and *update* the content, structure, and style of a document."

- Standard **data structure** for representing the web page content

- Allows to get, change, add, or delete HTML elements

- Supported by all browsers

- **JavaScript programs can read and modify the DOM**

- Abstracts and standardizes APIs to
  - Browser
  - HTML
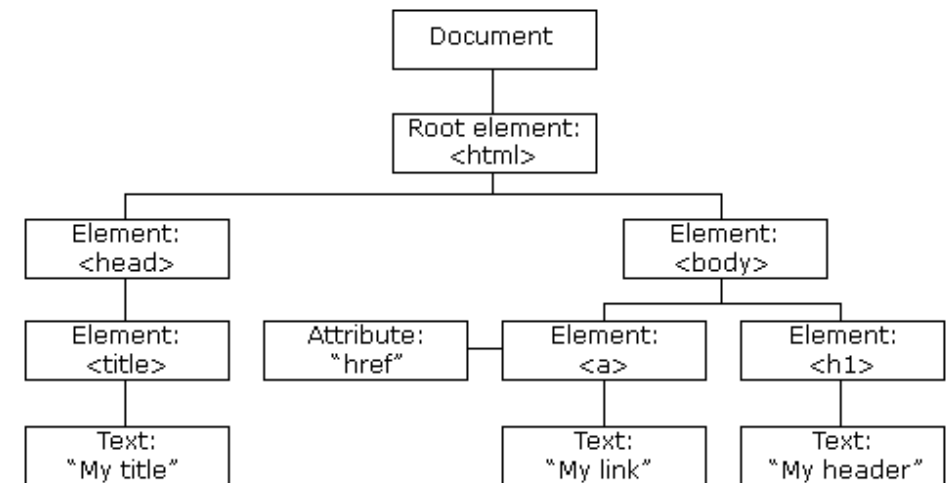

Cascading Style Sheets (CSS)

- Allow the definition of complex layouts

- Adapt web pages to
  - different resolutions
  - different devices (e.g., smartphones)
  - different preferences (e.g., color schemes)
  - to different media (e.g., text vs. video)
  - in a standard way

Cascading Style Sheets (CSS)

- A set of "*declarations*" applied to some "*selectors*"
  - Selectors identify portions of the DOM
  - Declarations set the value of some properties
  - Properties control everything
    - color, size, font, alignment, border, shadow, position, selection status, transitions, links, buttons, cursors, …
JavaScript

- JS Interpreter Embedded in the Browser
  - Executes within a strict "sandbox"
- JS Scripts loaded by the HTML page
  - `<script src="/js/myscript.js" type="text/javascript"></script>`
- JS Scripts have read-write access to
  - Browser API
  - HTML DOM (including form data)
  - User events and actions

HTTP Protocol

URI, HTTP methods, JSON data

HTTP protocol

```
GET / HTTP/1.1
Host: www.polito.it
User-Agent: Mozilla/5.0 (Windows NT 10.0; Win64; x64; rv:86.0) Gecko/20100101 Firefox/86.0
Accept: text/html,application/xhtml+xml,application/xml;q=0.9,image/webp,*/*;q=0.8
Accept-Language: en-US,en;q=0.5
Accept-Encoding: gzip, deflate, br

Last-Modified: Tue, 09 Mar 2021 14:03:41 GMT
Cache-Control: no-cache, must-revalidate
Vary: Accept-Encoding
Content-Encoding: gzip
Content-Length: 11905
Keep-Alive: timeout=15, max=100
Connection: Keep-Alive
Content-Type: text/html; charset=UTF-8

<!doctype html>
<html xmlns="http://www.w3.org/1999/xhtml" lang="it">
<head>
        <meta charset="UTF-8">
        <title>Politecnico di Torino</title>
. . .
```

Header

Blank line

Body

HTTP Response Body

Generation

- Empty Response Body
  - Errors
- Static file (exists in the server)
  - HTML (seldom)
  - Images, JavaScript, CSS, …
- Dynamically generated on-the-fly by the server
  - HTML (generated with templates)
  - JSON data

File and Content Type

- HTTP does not care about the meaning of the payload
- Web content
  - HTML, CSS, JS
  - Used by the browser
- Data content (API)
  - JSON, XML, binary data, …
  - Used by JavaScript code

Dynamic Web Transaction

Web Application Architecture

Web Server

Serving pages, Serving files,
Executing (REST) APIs

Web Server

- A web server delivers web resources in response to a request
    - manages the HTTP protocol to handle requests and provide responses
- It either reads or generates a web page
    - receives client requests
    - reads *static page* from the filesystem
    - asks the application server to generate *dynamic pages* (server-side)
    - provides a file (HTML, CSS, JS, JSON, …) back to the client
- One HTTP connection for each request
- Multi-process, multi-threaded or process pool

Web Server

Web server developers: Market share of all sites

Web server with Node.js

- Node.js provides a module '`http`' that implements a basic web server
- `Express`: a simple and extensible web server, easy to extend with many available extensions - http://expressjs.com/
- Other alternatives:
  - Fastify: focuses on performance
  - Koa: by Express authors, simplifies callbacks using 'ES6 generators' (yield instruction)
  - Meteor: full-stack, more complex and complete, also with a client-side component to synchronize state
  - Sails.js: based on MVC+ORM principles
  - ... many more

Web Architecture

ARCHITECTURAL PATTERNS

"Traditional" Architectural Pattern

- The "Rich-Client" is the "traditional" approach, now

- The server sends a new HTML page for each request it receives
  - with related resources (i.e., images, CSS, ...)
  - some parts of those pages can be, then, dynamically updated with asynchronous JavaScript requests

- A web application is doing **server-side rendering**, and a *multi-page* web application is created

All The Layers At Work…

Modern Patterns

Other three patterns to architect a web application exist, roughly

1. **Single-Page Application** (SPA)

   – the server sends the <u>exact same</u> web page for every unique URL

   – the page runs JavaScript to change the content and the aspect

   – by querying another (logical) server which provides "raw" information

Single-Page Application

- An *evolution* of the "traditional" approach
  - JavaScript starts with an (almost empty) HTML
  - add all the content dynamically
  - instead of asking for data to update some parts of a well-formed page
- Goal: to serve an outstanding User Experience with no page reloading and no extra time waiting
- Examples: Google Docs, Trello

SPA: Disadvantages

- SEO optimization is hard
  - Google launched a new scheme to increase single-page app SEO optimization, but this means extra work for the developer
- Browser history is not working
  - Web History API exists to tackle this problem and to allow a developer to emulate the back and forth action
- Security issues
  - Given that "all the logic is in the client", special care should be taken when handling access control. Cross-Site Scripting (XSS) is a problem as well.
- Client-side rendering can be slow!
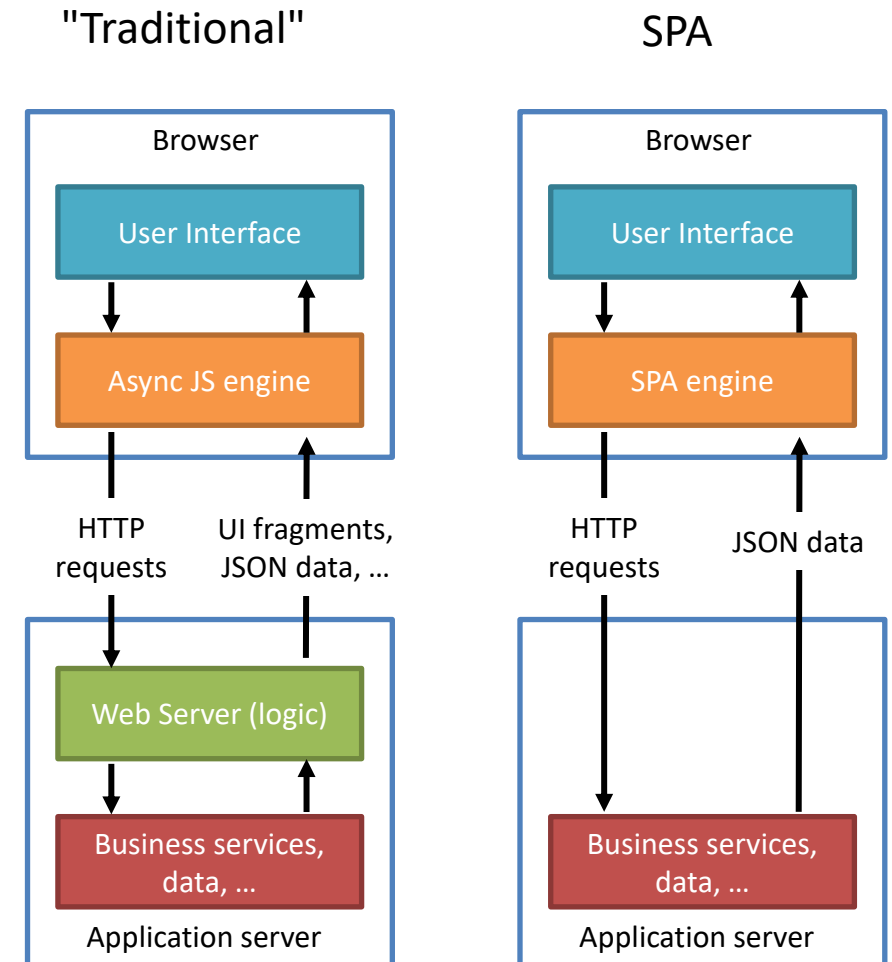

Modern Patterns

Other three patterns to architect a web application exist, roughly

1. **Single-Page Application** (SPA)
   - the server sends the <u>exact same</u> web page for every unique URL
   - the page runs JavaScript to change the content and the aspect
   - by querying another (logical) server which provides "raw" information

2. **Isomorphic Application**
   - Combination of SPA with server-side rendering

3. **Progressive Web App (PWA)**
   - Web applications that emulate "native" apps
Supporting mobile development

Client-side, server-side, databases

Websites	Popularity (unique visitors per month)[1]	Front-end (Client-side)	Back-end (Server-side)	Database
Google[2]	1,600,000,000	JavaScript, TypeScript	C, C++, Go,[3] Java, Python, Node	Bigtable,[4] MariaDB[5]
Facebook	1,100,000,000	JavaScript, Flow	Hack, PHP (HHVM), Python, C++, Java, Erlang, D,[6] XHP,[7] Haskell[8]	MariaDB, MySQL,[9] HBase, Cassandra[10]
YouTube	1,100,000,000	JavaScript	C, C++, Python, Java,[11] Go[12]	Vitess, BigTable, MariaDB[5][13]
