

# Summary

---

1. Definition
2. Application Domains
3. Reference Architecture

# Definition

## Web Information Systems

# Definition

---

- ▶ **Web Information System (WIS)**
  - ▶ Communication between computers and hosts takes place in the Internet or through a Virtual Private Network (VPN) based on the internet standards
  - ▶ Access to information and services is supported by program that manage the user interface, known as browser

Cap. 3  
Pag. 93

# Actors

---

# Collaboration models

---

- ▶ **B2B (business to business ):** collaboration among companies
- ▶ **B2C (business to consumer ):** on-line shops
- ▶ **C2C (consumer to consumer ):** auctions, buy-sell notices
- ▶ **Government to business :** on-line taxes, services to companies
- ▶ **Government to citizens :** on-line taxes

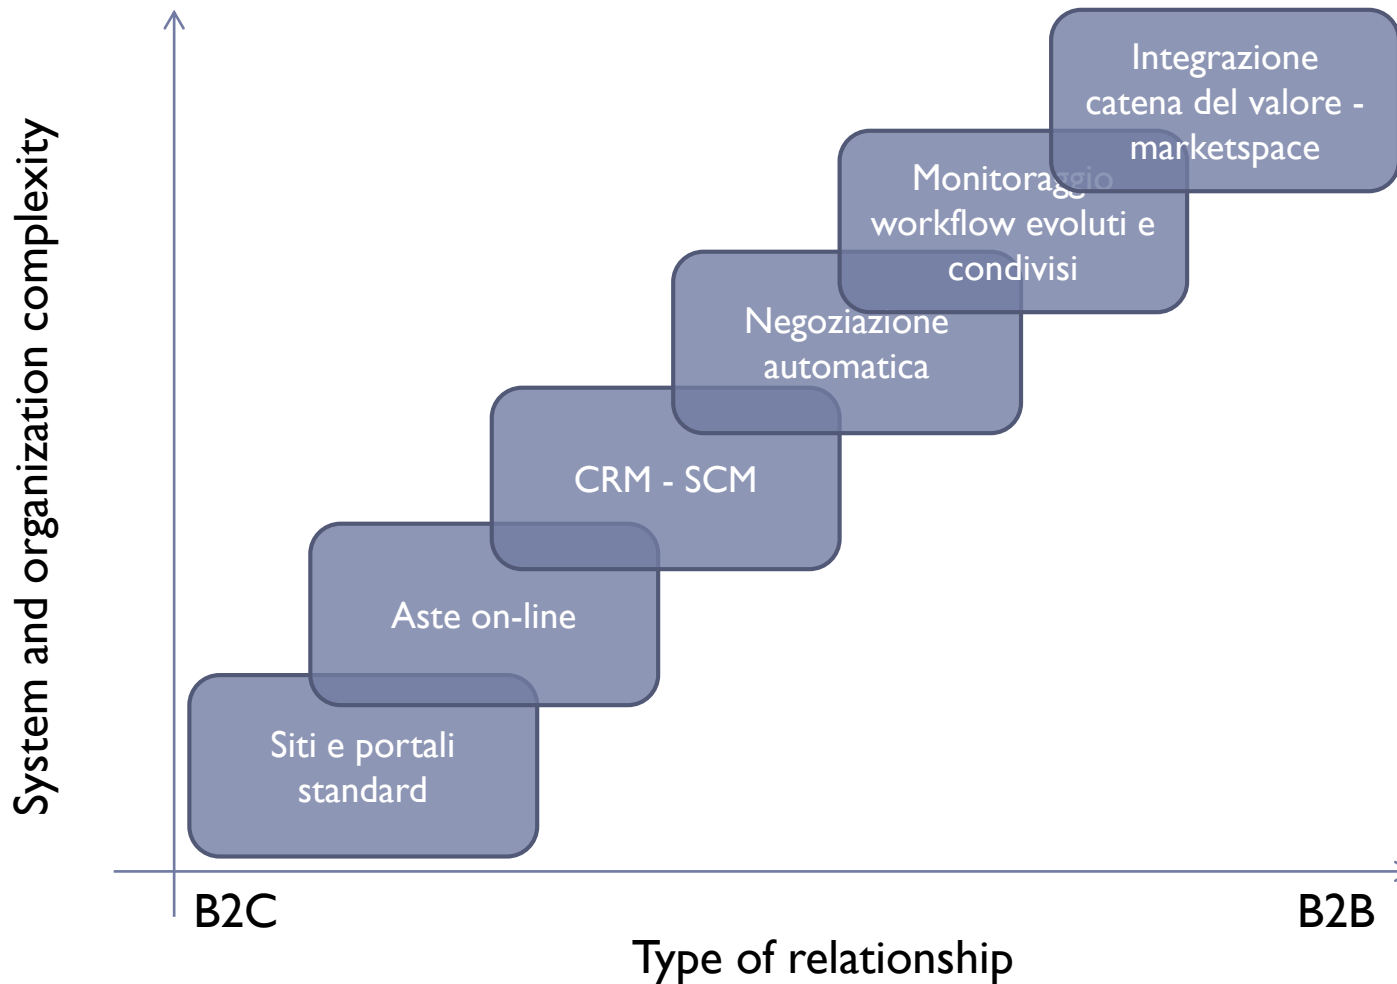

# Examples

---

- ▶ On-line shops of consumer goods
- ▶ On-line auctions
- ▶ Thematic portal (links, user community, latest news)
- ▶ Distribution of components or raw materials
- ▶ Services (bank, finance, insurance, travel, consultancy, ...)
- ▶ Publications (newspapers, encyclopedias, press agencies, ...)

# A possible taxonomy

# Levels of complexity

---

- ▶ **Informative sites**
  - ▶ Who we are / Products / Services / Contacts
  - ▶ Newsletter, Journal, Blog, ...
- ▶ **Ordering sites**
  - ▶ Product selection, configuration, purchase
- ▶ **Management systems**
  - ▶ CRM, SCM, ERP, MRP, ...
- ▶ **Autonomous systems**
  - ▶ Negotiation, transaction, monitoring
- ▶ **Portals, marketplace, marketSPACE**
  - ▶ Aggregation of several related companies/products

# Evolution of web architectures

<http://www.evolutionoftheweb.com>

Credits

# N-tier (N-level) architecture

---

- ▶ Each level/tier has a well defined role
- ▶ One or more servers implement each tier/layer
- ▶ More servers can share the same hardware or can run on dedicated devices
- ▶ Communication between tiers/levels is achieved through the network

# General Architecture

---

- Historically, a web browser
- Also:
  - Mobile app
  - Desktop app
  - Other server application

# General Architecture

---

# Components

---

- ▶ One or more connections to the Internet by means of an Internet Service Provider (ISP).
- ▶ One or more servers implementing each tier/level of the architecture.
- ▶ One or more physical networks for interconnecting the servers.
- ▶ One or more network devices (router, firewall, switch) which implement communication and security policies.

# Definition

---

- ▶ “Server” may be defined as:

- ▶ Logical definition:

- A **process** that runs on a host that relays information to a **client** upon the client sending it a **request**.

- ▶ Physical definition:

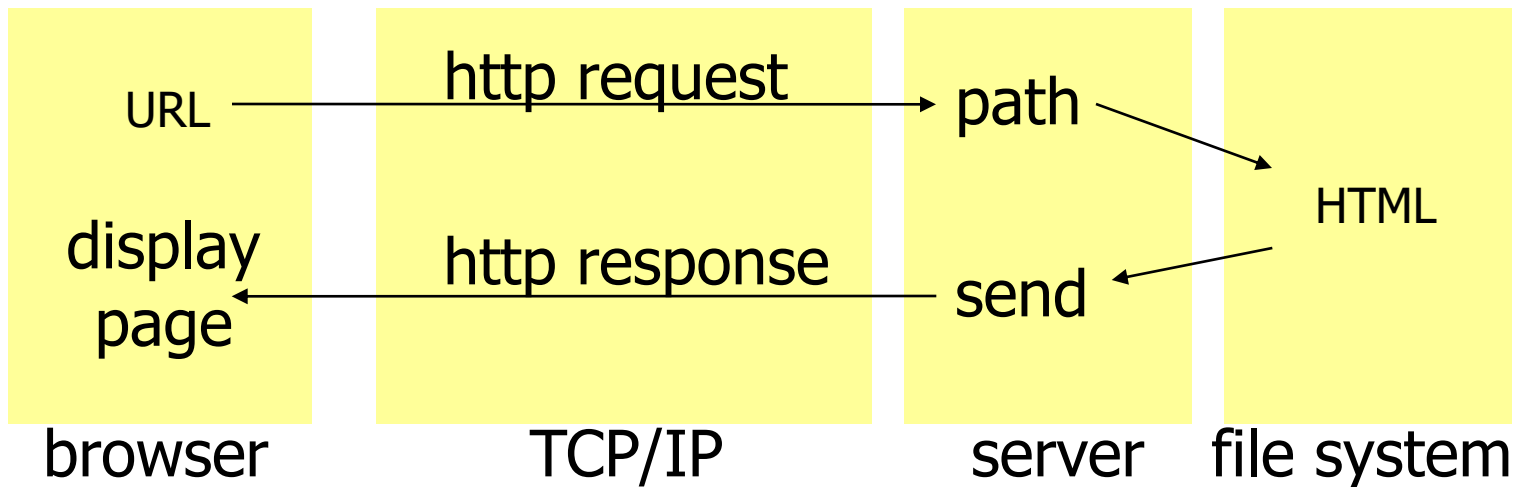

- A **host computer** on a network that holds information (eg, Web sites) and responds to requests for information

# Web server

---

- ▶ Manages the HTTP protocol (handles requests and provides responses)
  - ▶ Receives client requests
  - ▶ Reads static pages from the filesystem
  - ▶ Activates the application server for dynamic pages (server-side)
  - ▶ Provides an HTML file back to the client
- ▶ One HTTP connection for each request
- ▶ Multi-process, Multi-threaded or Process pool

# Example

# Adopted standards

---

- ▶ URL (uniform resource locator) for finding web pages
- ▶ HTML (hyper text markup language) for writing web pages
- ▶ GIF (graphics interchange format) for images
- ▶ HTTP (hyper text transfer protocol) for client-server interaction
- ▶ TCP/IP (transmission control protocol over internet protocol) for data transfer

# HTML in 5 minutes

The screenshot shows the homepage of w3schools.com. The header includes the logo, the text "w3schools.com the world's largest web development site", and the slogan "educate yourself! beginners and experts". A search bar is located on the right. The main content area is organized into several sections:

- HTML/CSS**: Includes links for "Learn HTML", "Learn HTML5", "Learn CSS", "Learn CSS3", and "Learn Bootstrap".
- JavaScript**: Includes links for "Learn JavaScript", "Learn jQuery", "Learn jQueryMobile", "Learn AppML", "Learn AngularJS", "Learn AJAX", and "Learn JSON".
- HTML Graphics**: Includes links for "Learn Canvas", "Learn SVG", and "Learn Google Maps".
- Server Side**: Includes links for "Learn SQL", "Learn PHP", "Learn ASP", and "Learn ASP.NET".
- XML**: Includes links for "Learn XML DOM", "Learn XPath", "Learn XSLT", and "Learn XQuery".

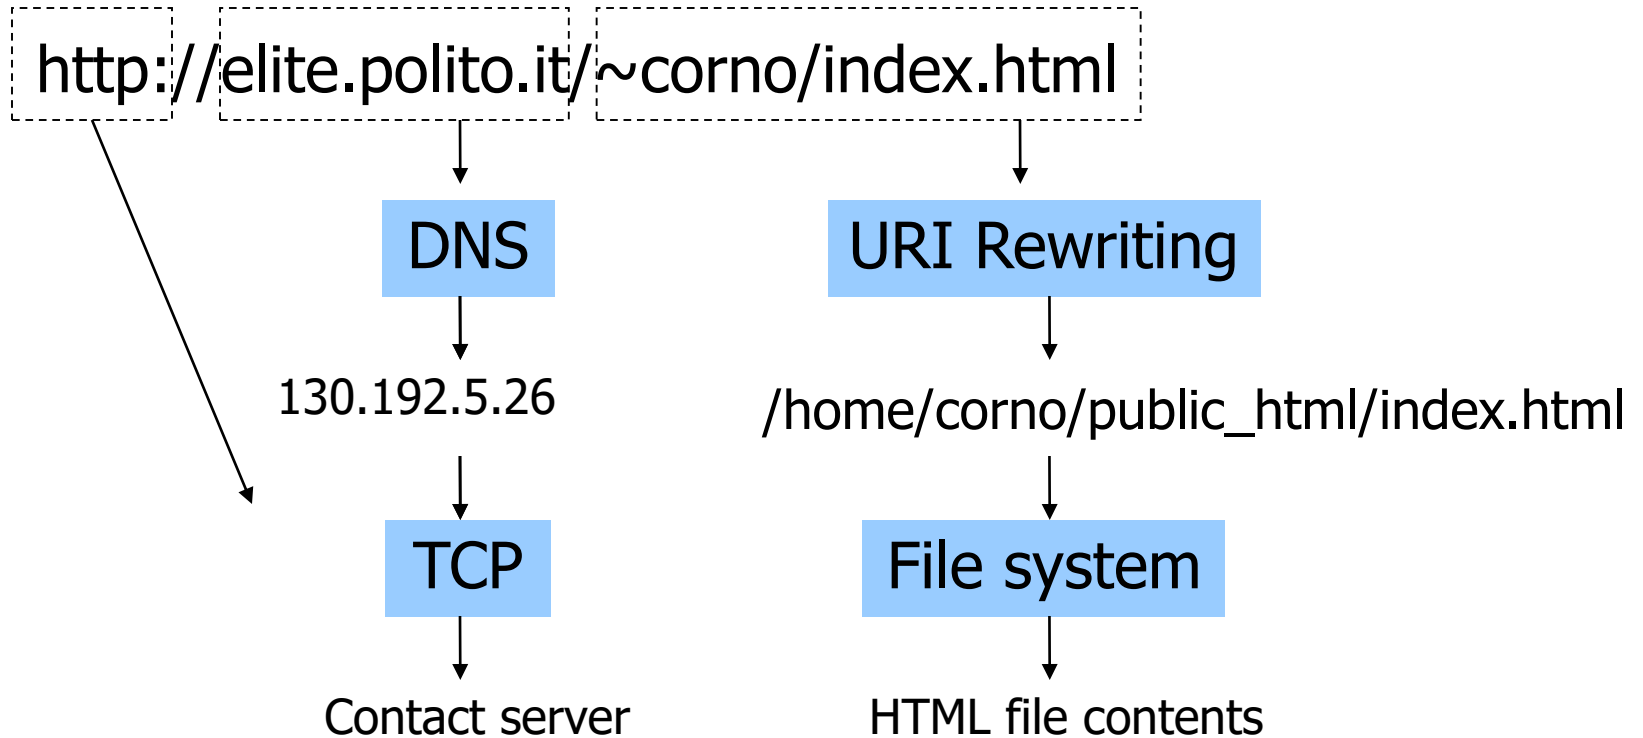

Each section has corresponding "Tutorial" and "Reference" buttons. A large "Learn Web Building" button is centered at the bottom. A search bar is also present on the right side of the page.

# URI Basics

---

- ▶ **http://www.sadev.co.za/users/1/contact**  
Scheme                      Hostname                      Query  
Scheme                      Hostname                      Query
- ▶ **http://www.sadev.co.za?user=1&action=contact**  
Scheme      Userinfo                      Hostname      Port
- ▶ **http://rob:pass@bbd.co.za:8044**  
Scheme                      Hostname                      Query                      Fragment
- ▶ **https://bbd.co.za/index.html#about**

# HTTP protocol

---

RFC 2616, RFC 2617  
<http://www.w3.org/Protocols>

```
GET /~corno/index.html HTTP/1.0
Accept: text/html
Accept: image/gif
User-Agent: FireChrome SuperBrowser 9.45
```

```
HTTP/1.0 200 OK
Date: Monday, 01-Jan-2001 00:00:00 GMT
Server: Apache 1.3.0
MIME-Version: 1.0
Last-Modified: 31-Dec-2000
Content-type: text/html
Content-length: 3021

<HTML> . . .
```

# Browser developer tools

The image displays a browser window with the developer tools interface open. The browser shows the e-Lite website (elite.polito.it) with a navigation menu and several featured articles. The developer tools are open to the Network tab, showing a list of requests. The selected request is for the main page (elite.polito.it), and the Headers tab is active, displaying the response headers.

Metodo	File	Domini	Tipo	Dimensione	Header
200	GET	/	html	61,73 kB	URL richiesta: elite.polito.it
200	GET	smart-systems-banner-small.png	png	133,68 kB	Metodo di richiesta: GET
200	GET	_utm.gif?utmwv=5.6.4&utmcs=2&utmn=...	gif	0,04 kB	Status code: 200

**Network Log:**

- Name: elite.polito.it
- Path: /
- Method: GET
- Status: 200 OK
- Response Headers:
  - Cache-Control: no-store, no-cache, must-revalidate, post-check=0, pre-check=0
  - Connection: Keep-Alive
  - Content-Encoding: gzip
  - Content-Type: text/html; charset=utf-8
  - Date: Wed, 08 Apr 2015 13:47:35 GMT
  - Expires: Mon, 1 Jan 2001 00:00:00 GMT
  - Keep-Alive: timeout=15, max=100
  - Last-Modified: Wed, 08 Apr 2015 13:47:35 GMT
  - P3P: CP="NOI ADM DEV PSAI COM NAV OUR OTR STP IND DEM"
  - Pragma: no-cache
  - Server: Apache/2.4.6 (Linux/SUSE)
  - Transfer-Encoding: chunked
  - X-Powered-By: PHP/5.4.20

# Performance measures

---

- ▶ Latency: time required for providing a 0 byte http page. Includes the server activation time, the request decoding time, the file access time, the transmission time and the time for closing the connection.
  - ▶ Unit of measure: http/s or s/http
- ▶ Throughput: maximum speed at which infinite-sized pages can be sent.
  - ▶ Unit of measure: Bytes (Mbytes)/s
- ▶ #Requests / s

# Delay time

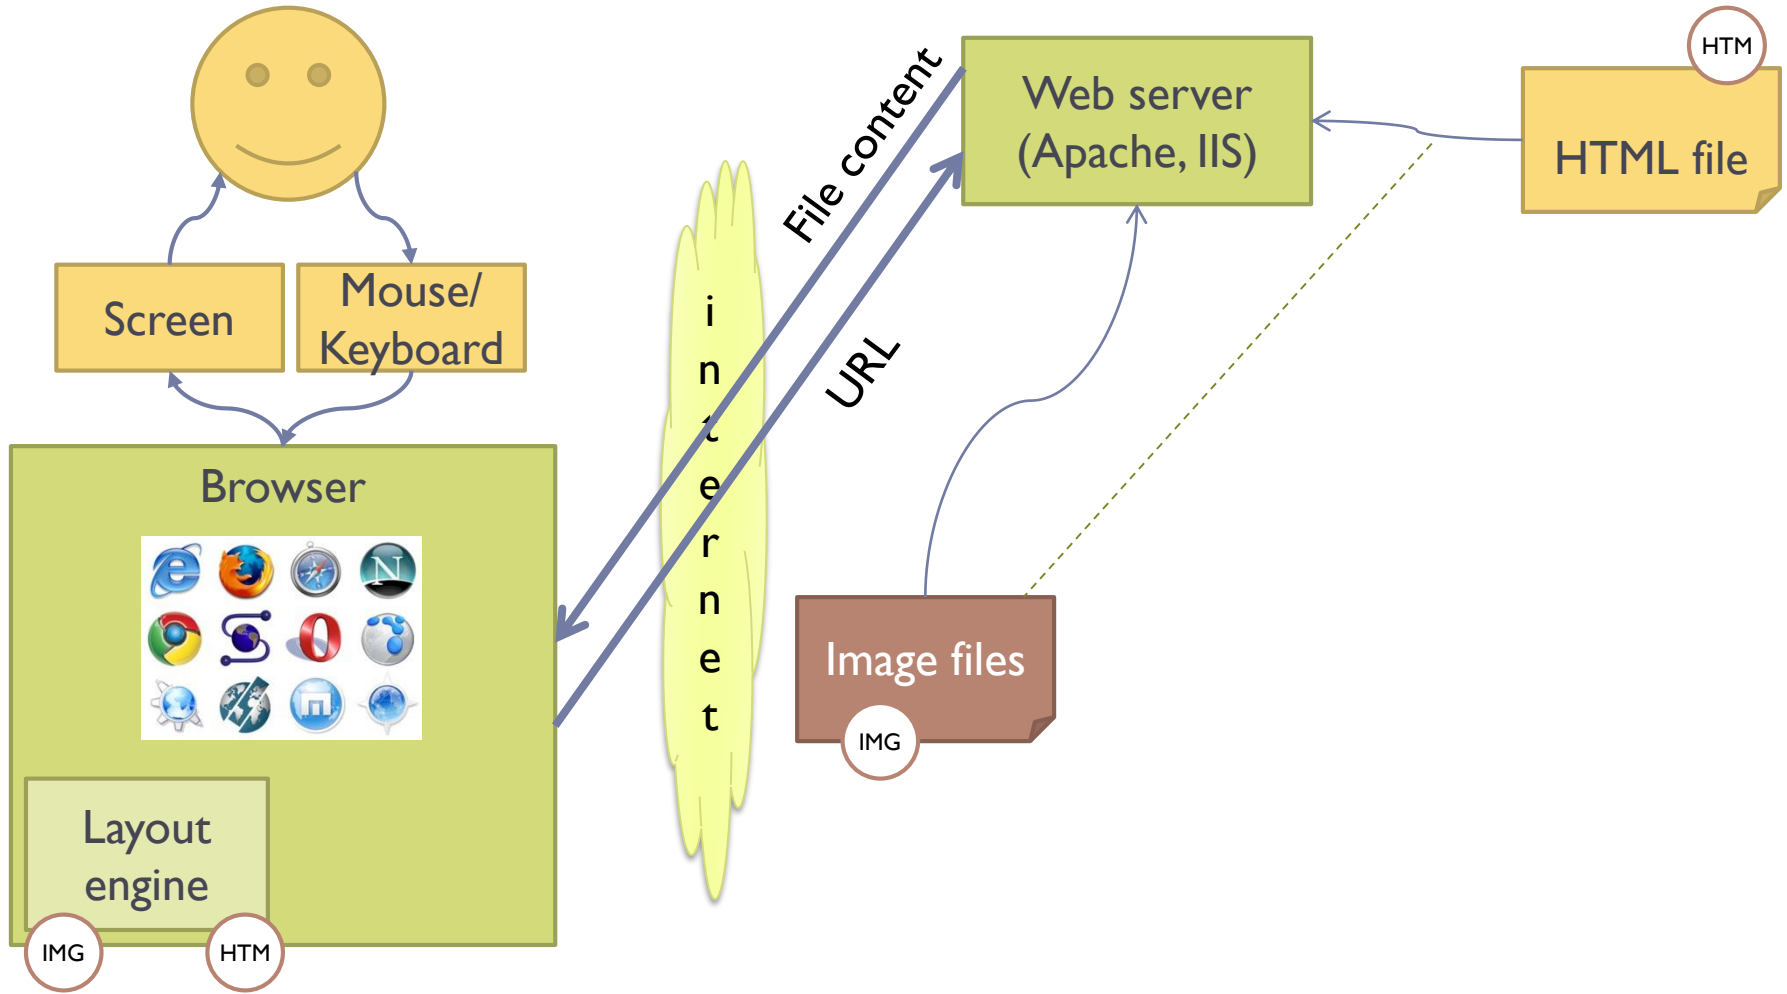

---

- ▶  $T = \text{Latency} + \text{Size}_{\text{HTML}} / \text{Throughput}$
- ▶ This equation is valid if:
  - ▶ The other architecture elements (I/O subsystem, network, ...) are not overloaded
  - ▶ The web server has not yet reached its maximum workload
- ▶ Example:
  - ▶ Latency: 0,1 s
  - ▶  $\text{Size}_{\text{HTML}}$ : 100kBytes
  - ▶ Throughput: 800kBytes/s
  - ▶  $T = 0,1\text{s} + 100\text{KBytes} / 800\text{KBytes/s} = 0,225\text{s}$

# Static web transaction

# General web architecture

# Market share of “all” sites

# Application server

---

- ▶ Dynamic page generation
- ▶ Manages the site business logic
- ▶ It's the middle tier between the client browser and the data residing on a database
- ▶ Implements the session mechanisms
- ▶ Different technologies and architectures are available

# Dynamic web transaction

# Adopted standards

---

- ▶ HTTP-POST for sending user-specified data
- ▶ CGI (common gateway interface), ISAPI (internet information server application programming interface), server-side script, java servlet for integrating application logic into web servers
- ▶ ASP (active server pages), PHP, PERL as new languages for application development

# URL (HTTP GET)

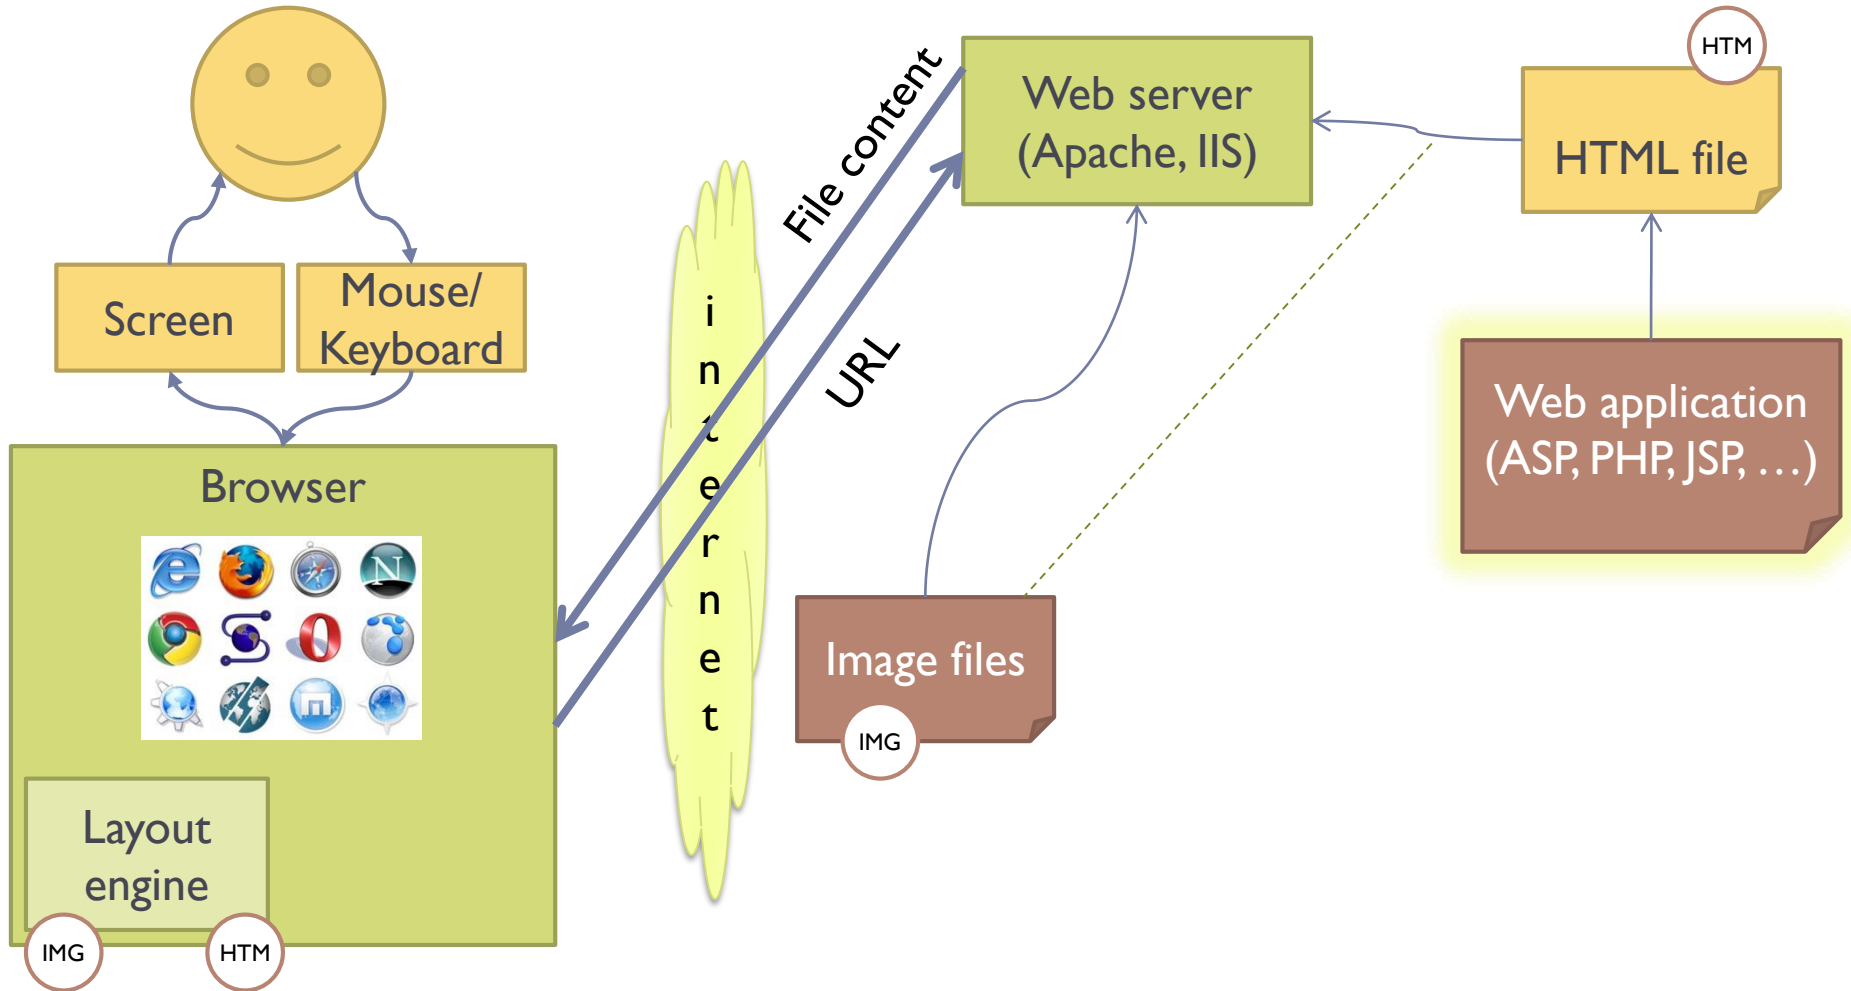

---

# Dynamic web transaction

# General web architecture

# Application Servers

## Percentages of websites using various server-side programming languages

# Application Servers

[https://en.wikipedia.org/wiki/Website#Dynamic\\_website](https://en.wikipedia.org/wiki/Website#Dynamic_website)

**App Server** most often used\*

REBELLABS

\* The results were normalized to exclude non-users

# Database server

---

- ▶ Stores the data on which the application server works.
- ▶ Executes the queries issued by the application server:
  - ▶ Updates the stored data
  - ▶ Inserts new data
  - ▶ Provides back query results
- ▶ The most frequent/complex queries can be implemented internally as stored procedures (pre-compiled queries with parameters)

# Example

# Adopted standards

---

- ▶ Cookies for storing the state of a session
- ▶ Java, JavaScript, ActiveX, Flash to program the user interface on the browser
- ▶ SQL (structured query language), ODBC (open database connectivity) to access data bases

# Database server

---

- ▶ Queries are almost always in SQL
  - ▶ `SELECT * FROM table;`
  - ▶ ....
- ▶ Often adopts the relational database model
  - ▶ Other models can be used
    - Object model
    - Triple model
- ▶ The most advanced/complete solutions are called Transaction servers

# Example (PHP)

---

The application composes the query

```
▶ <?php
▶ $query = "SELECT doc_id FROM key_doc_index, keywords WHERE
key_doc_index.key_id = keywords.id AND keywords.key =
$_REQUEST["query"];";
```

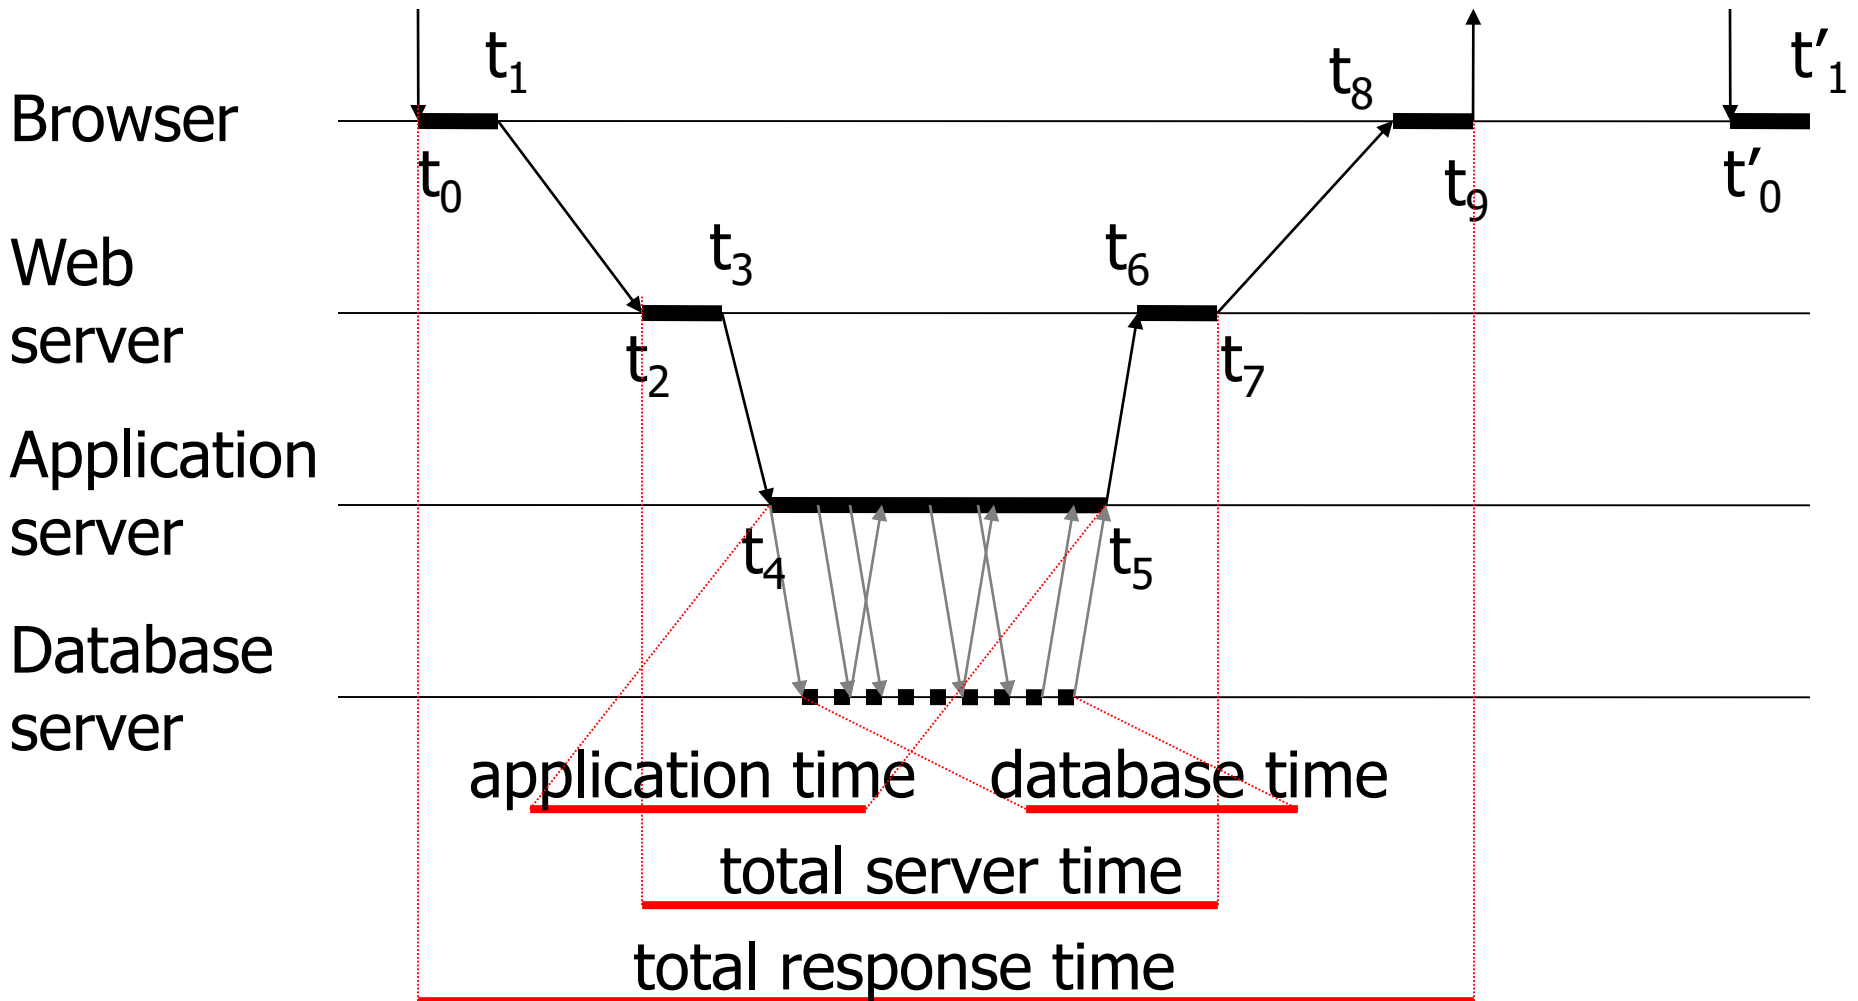

The query is sent to the db-server and a rowset containing the results is returned

```
▶ $rowset = mysql_query($query);
```

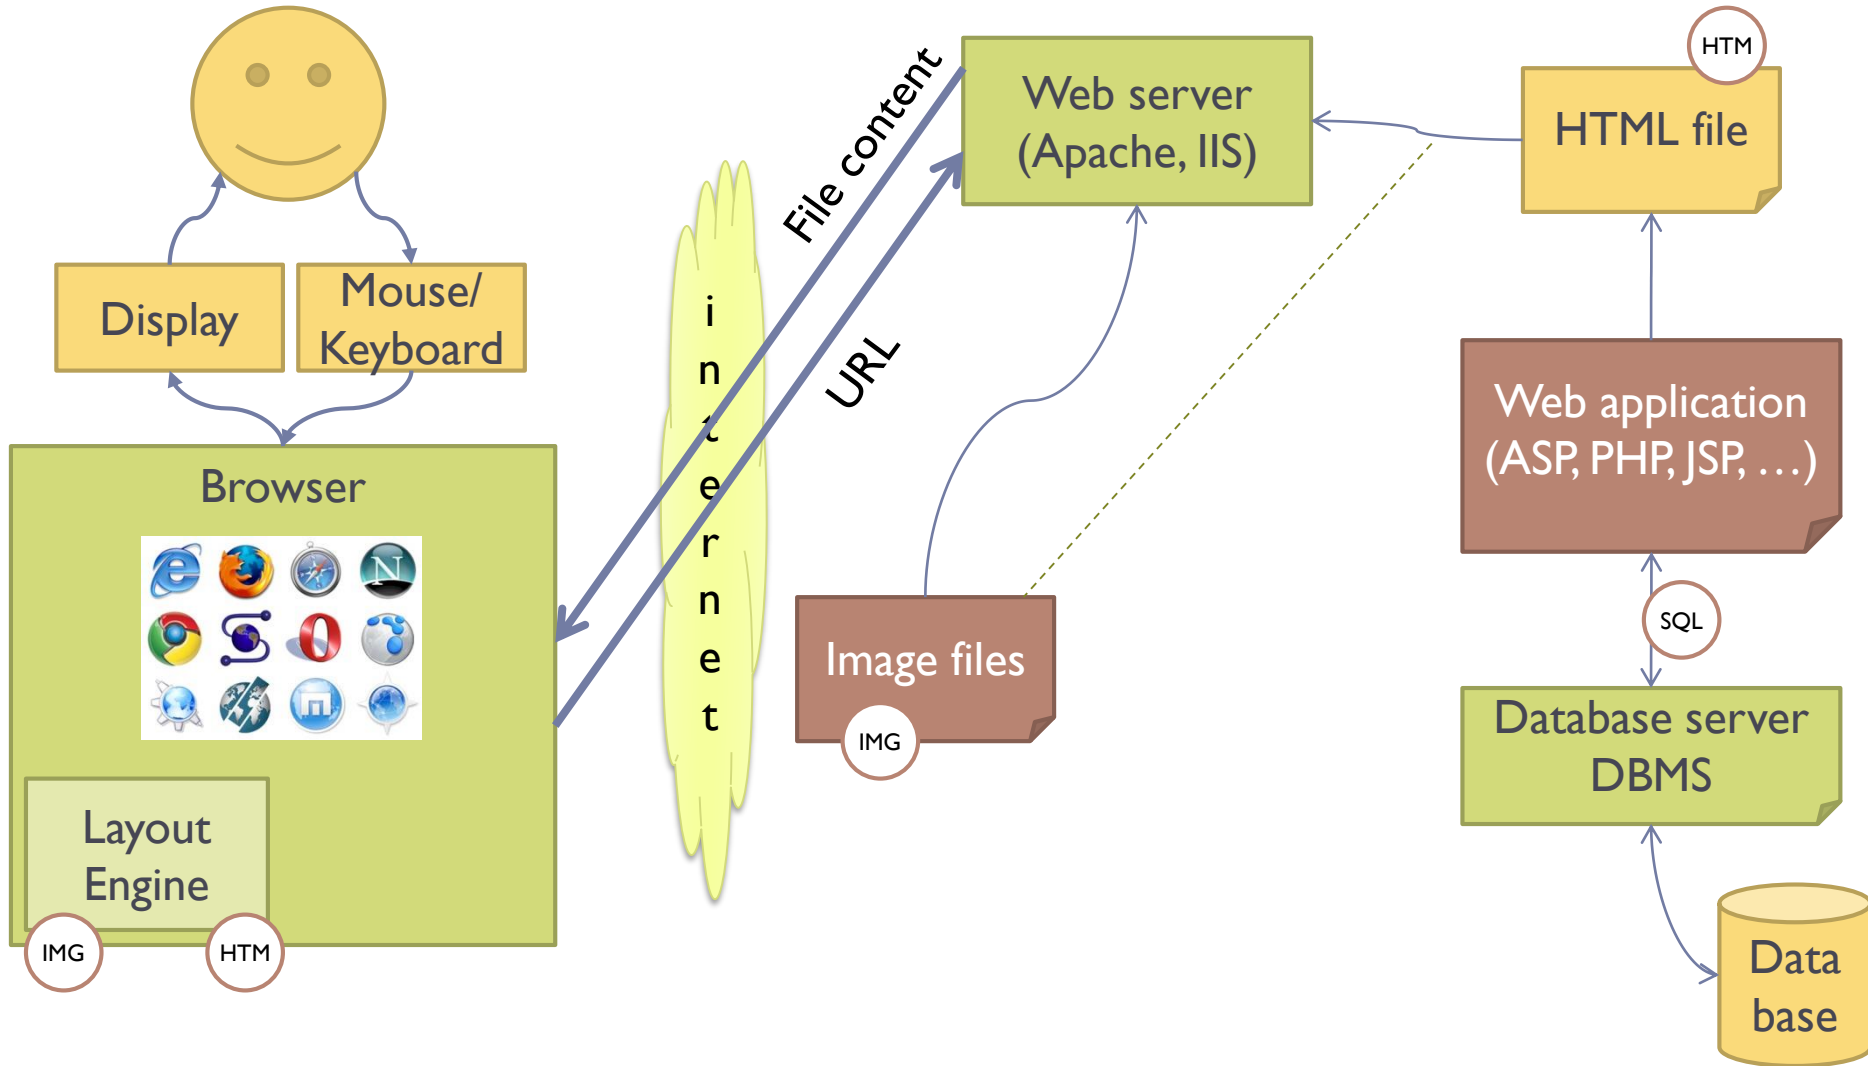

```
▶ while($row = mysql_fetch_row($rowset))
▶ {
▶ //elaborate data
▶ }
▶ ?>
```

The application elaborates the data

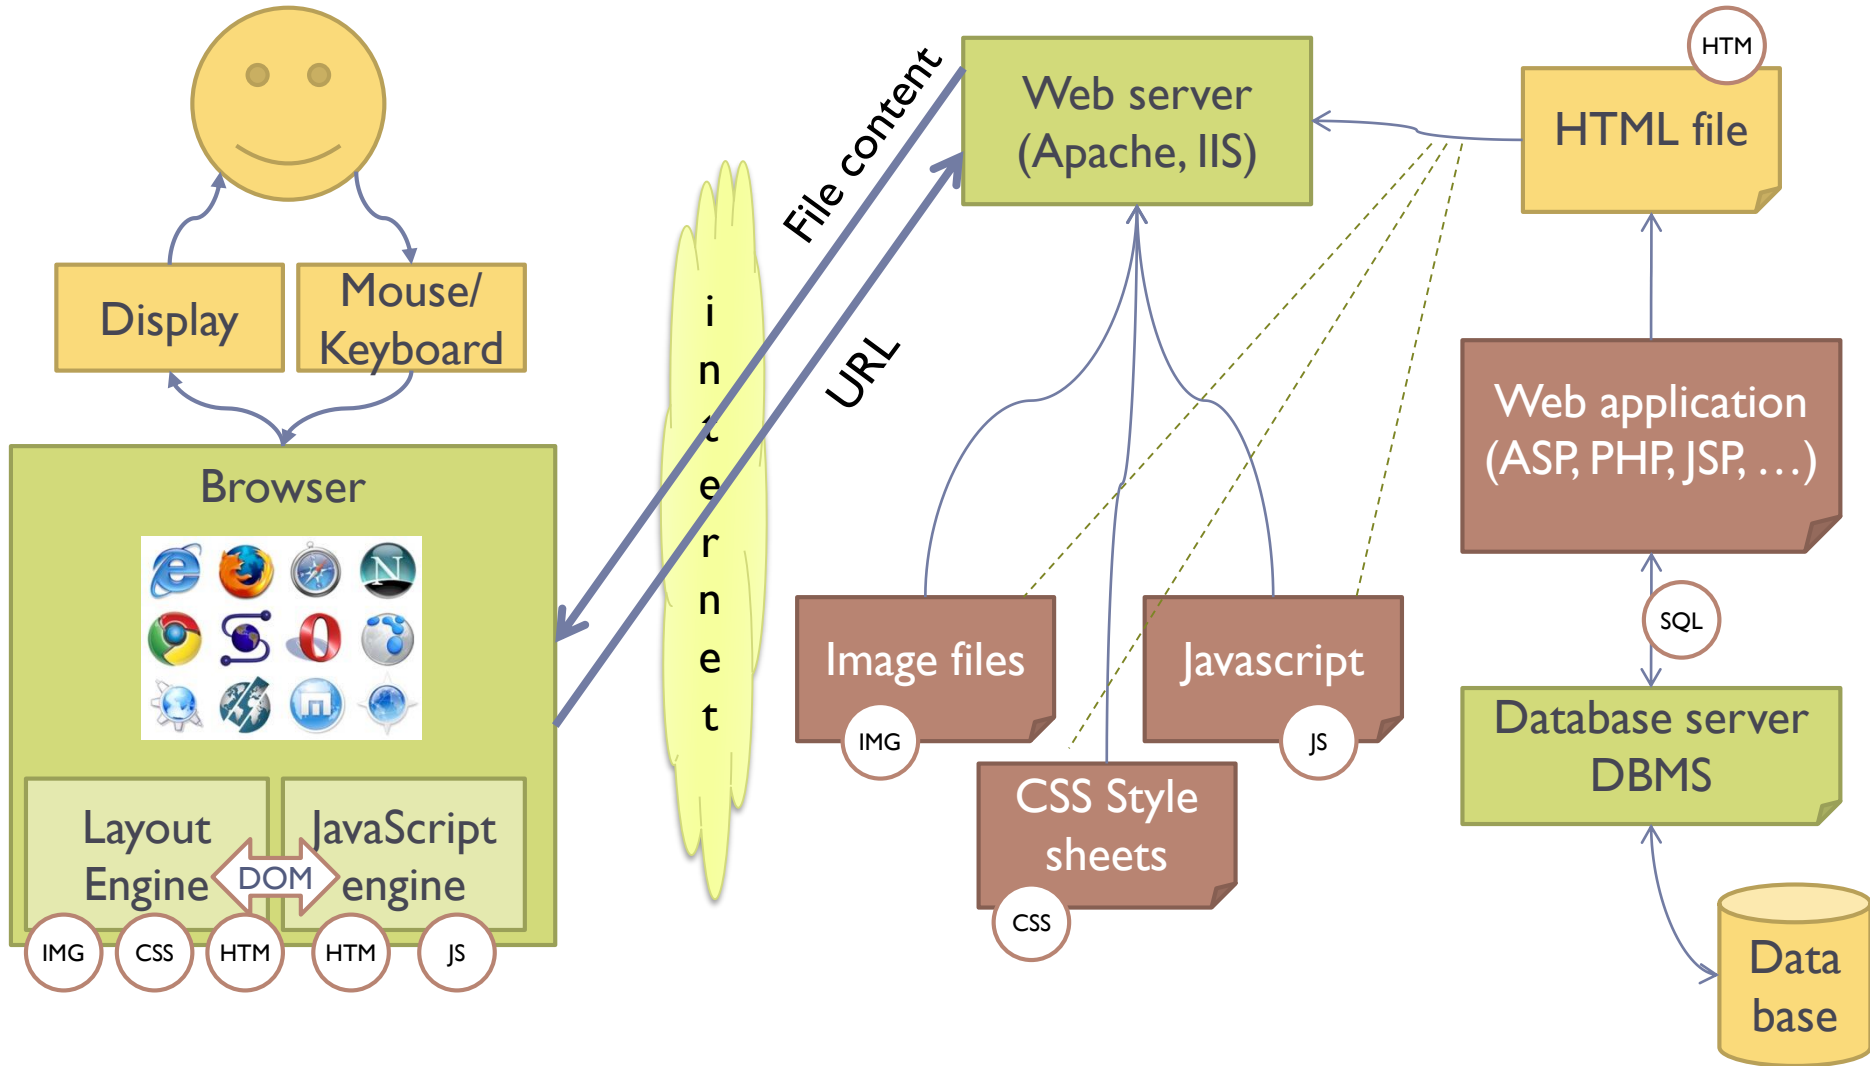

# Database-driven transaction

# Web 2.0

---

- ▶ Web applications support social interaction models
- ▶ Peer exchange and user-contributed content instead of rigid publisher/reader pattern
  - ▶ Online communities
- ▶ Rich, dynamic, interactive user interfaces
- ▶ Integration of contents across web sites (mashups)

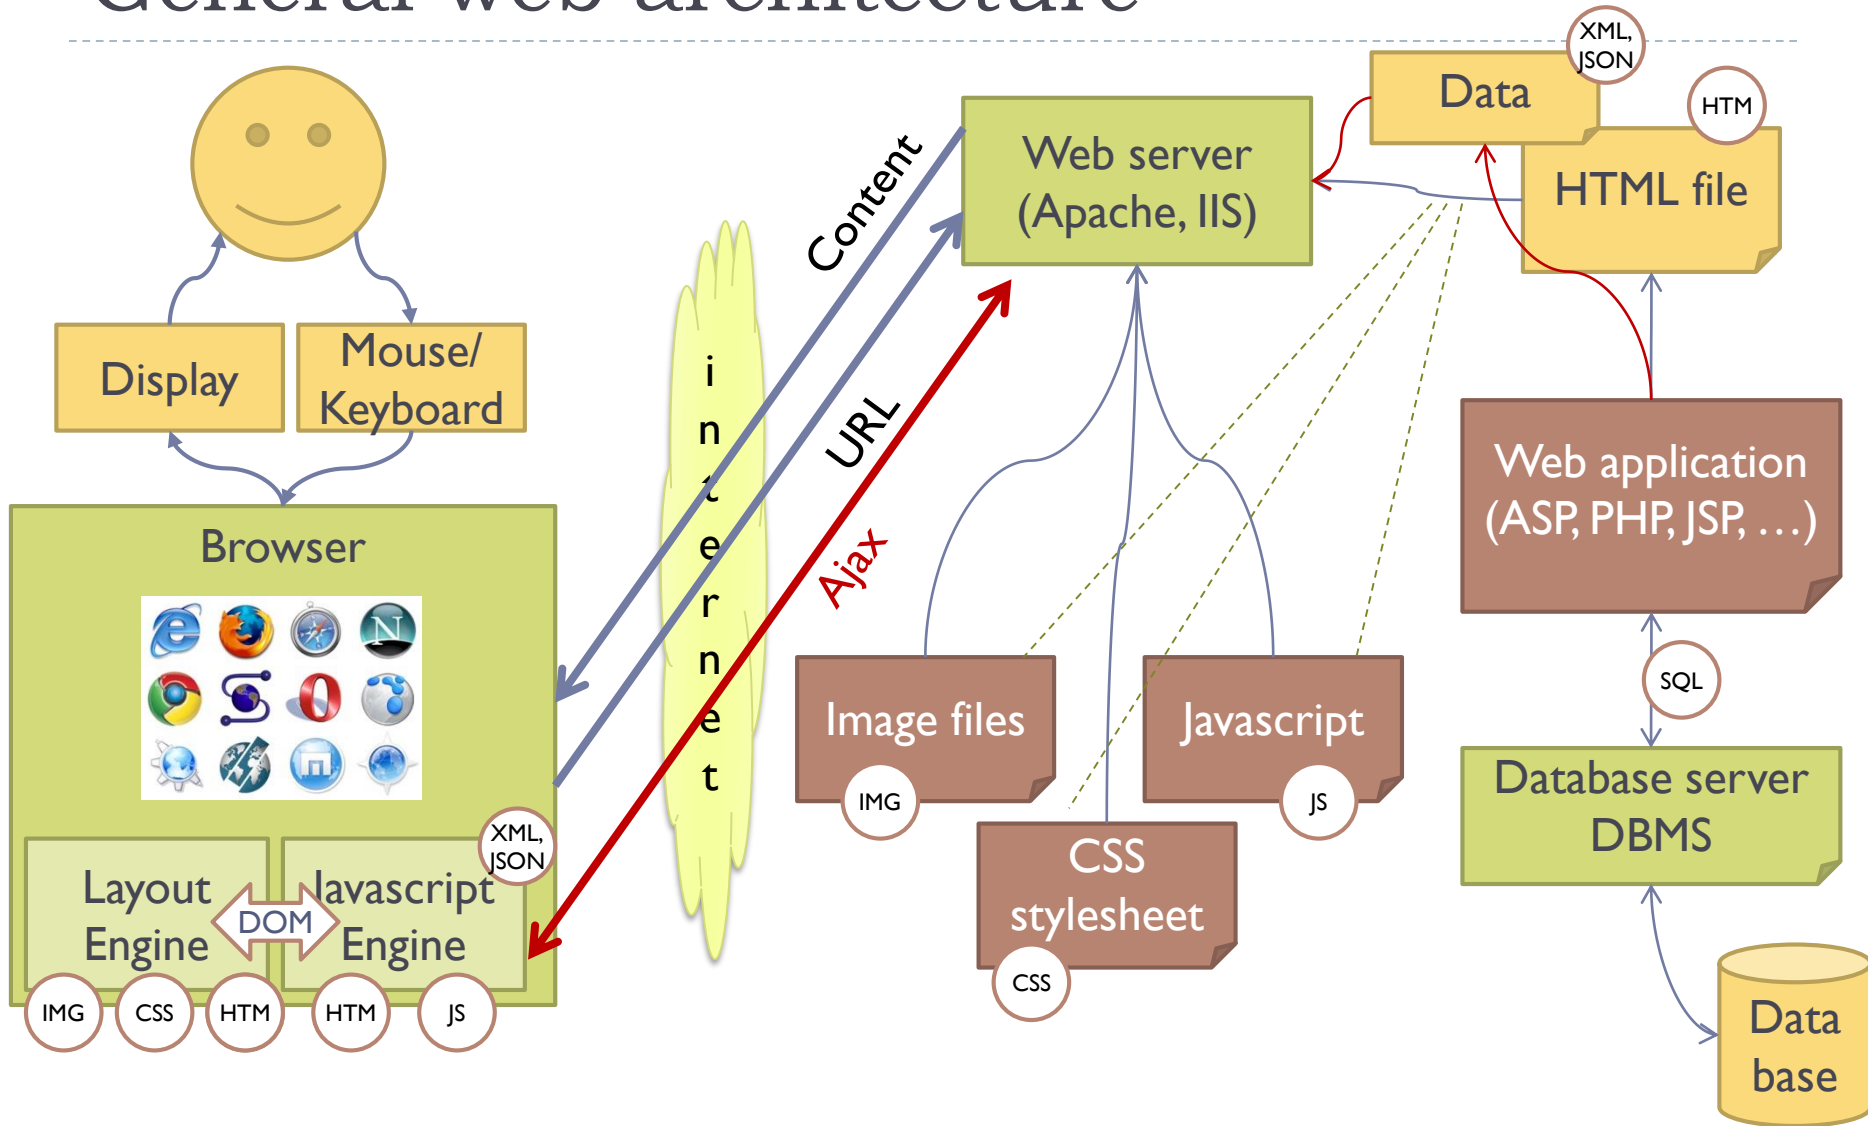

# Rich-Client Asynchronous Transactions

# Single Page Applications (SPA)

# General web architecture

# Adopted standards

---

- ▶ Dynamic HTML: DOM, Javascript, CSS
  - ▶ JavaScript, Flash to handle a runtime environment on the browser
  - ▶ DOM (XHTML Document Object Model) to allow on-the fly modification of the web page
  - ▶ CSS 2.1 to modify attribute and handle objects
- ▶ AJAX: Asynchronous Javascript and XML
  - ▶ XMLHttpRequest for asynchronous communication to the server
  - ▶ Data transfer formats: JSON, XML, RDF, RSS, Atom, FOAF, ...
- ▶ Mash-up technology

# Rich-client transaction

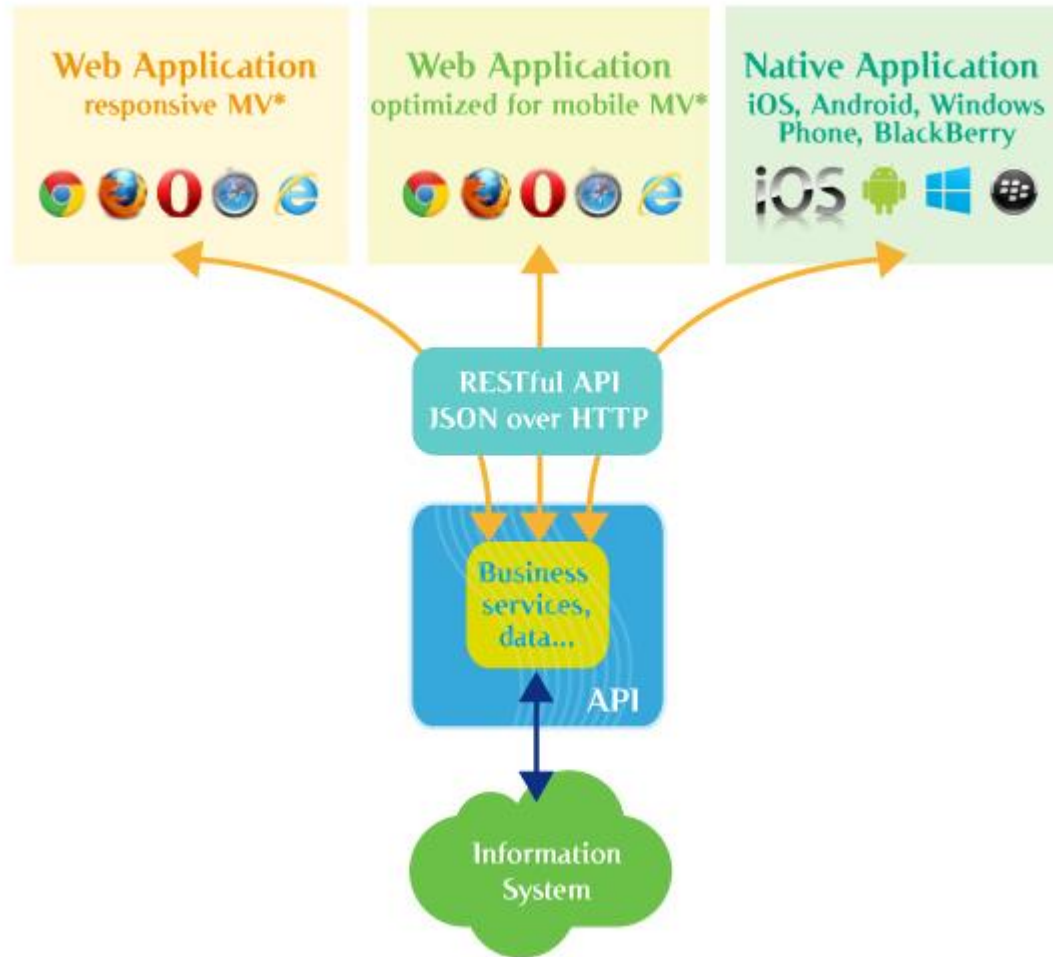

# Web application architectures

# Supporting mobile development

---

# Challenges for Enterprise Systems

---

- ▶ The users
- ▶ Functionality
- ▶ Flexibility
- ▶ Portability
- ▶ Reliability
- ▶ Security
- ▶ Integrity
- ▶ Maintenance
- ▶ Performance
- ▶ Scalability
- ▶ Costs
- ▶ Maintenance
- ▶ Development times
- ▶ Interactions with existing systems
- ▶ Interactions with the “physical” world

# E-business architectures

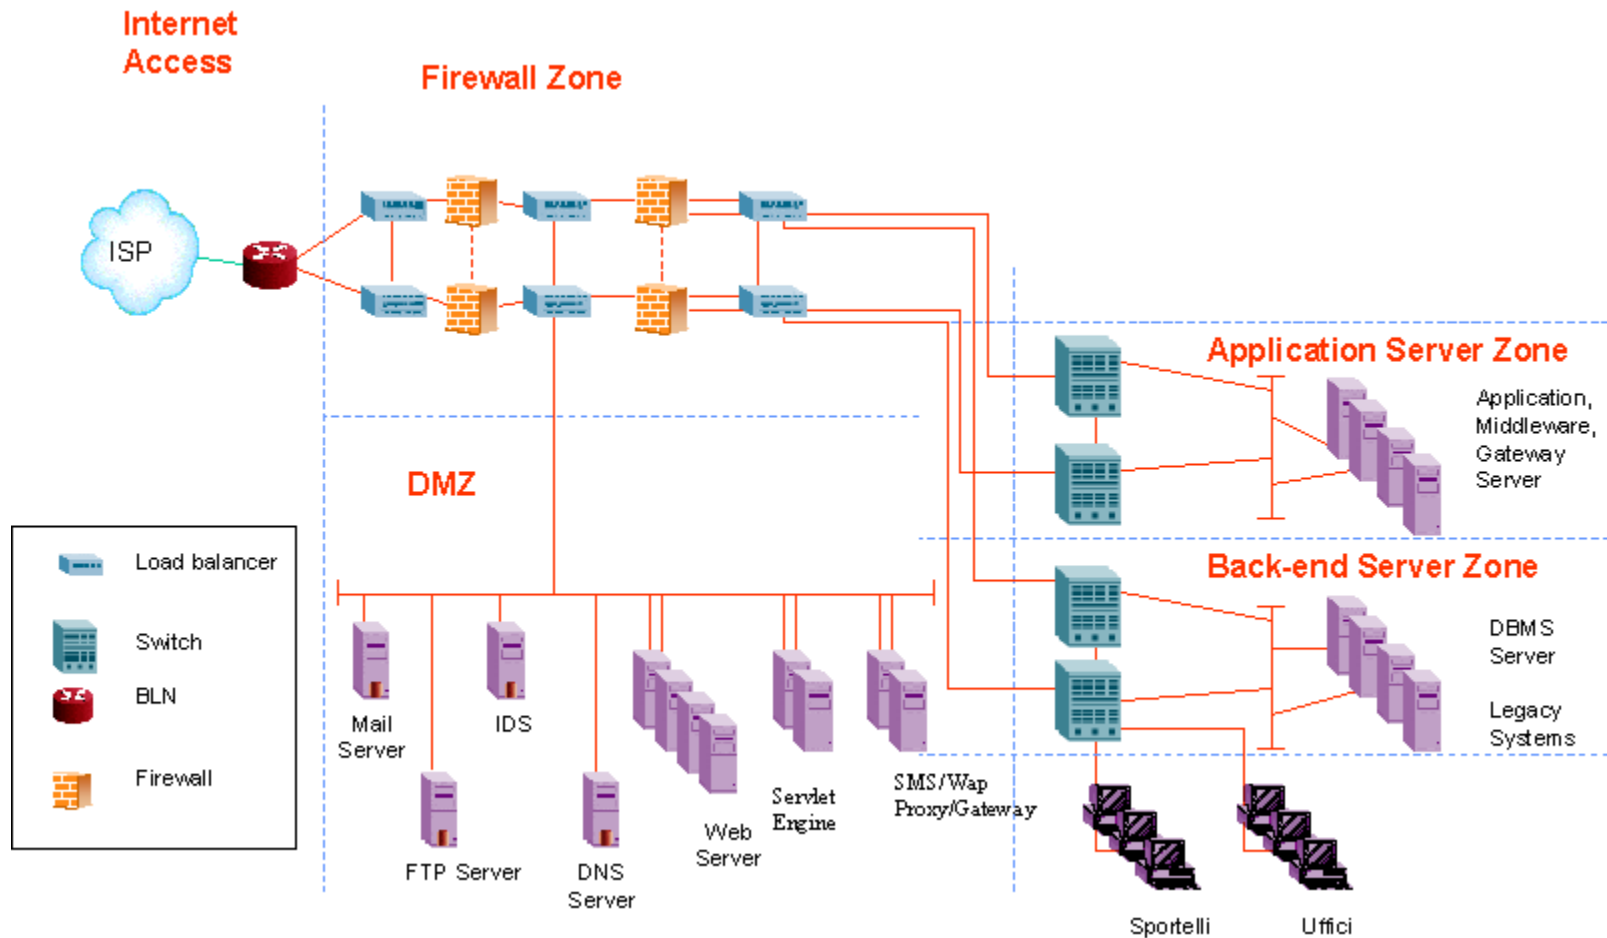

---

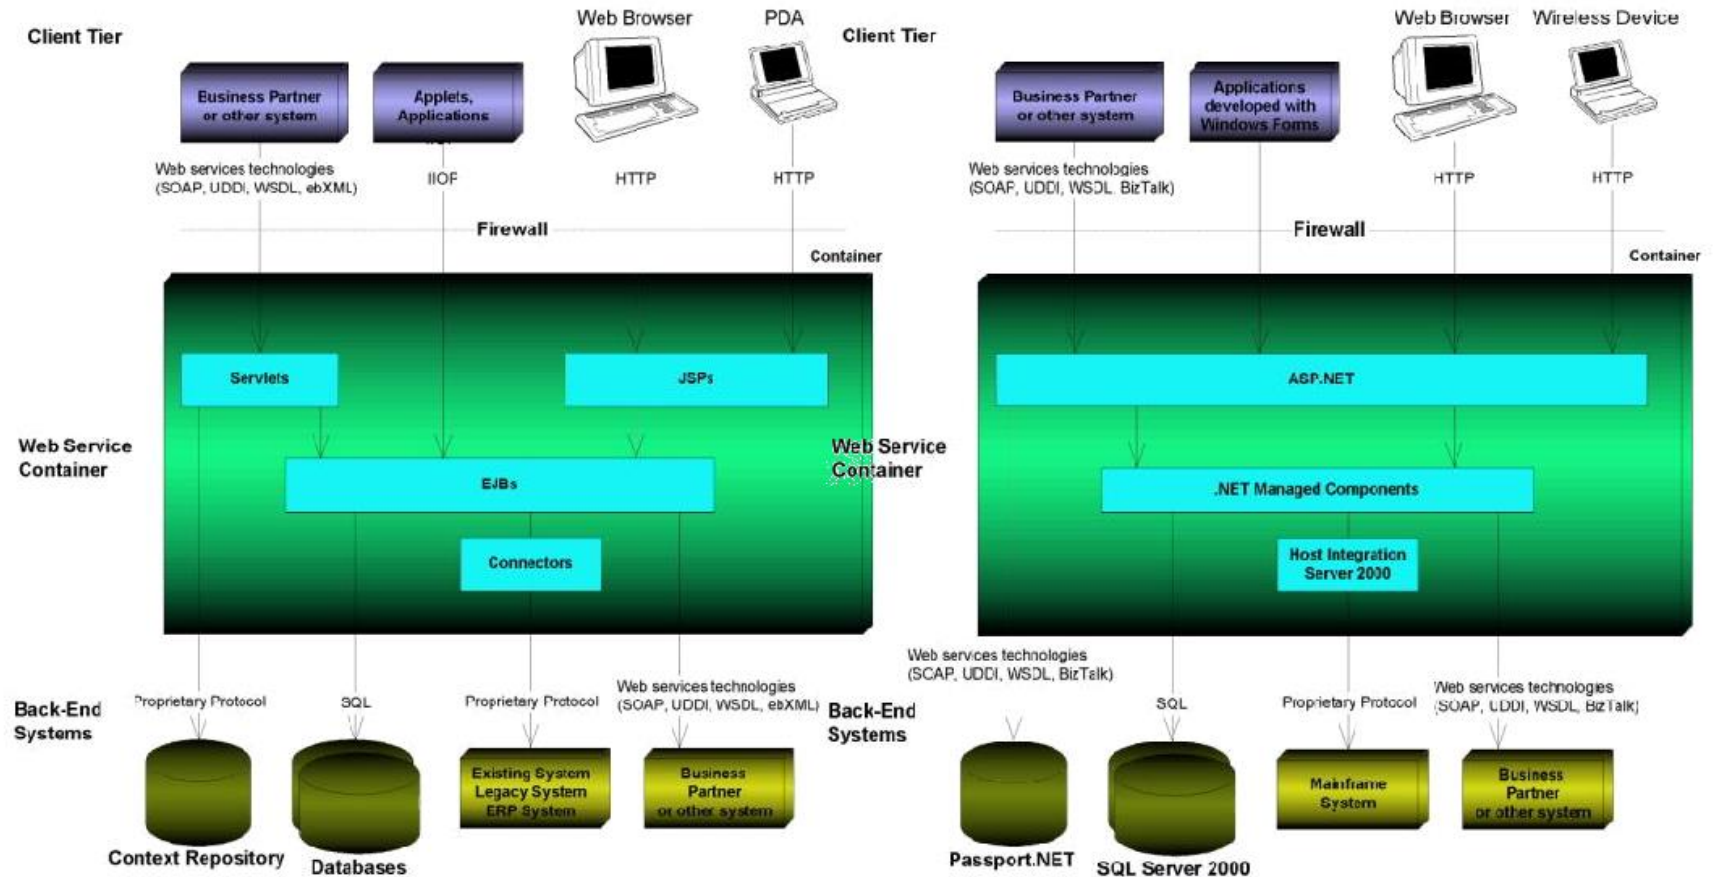

# Informative site – complete

# Ordering site – typical structure

# Legacy systems are always there...

# Interacting with other suppliers...

---

- ▶ Application Server needs to require services available on an external host
  - ▶ Ordering services (e.g. payment)
  - ▶ Informative services (e.g. stock quotes)
  - ▶ Security services (e.g. authentication)
- ▶ A web page contains sections originating from different sites
  - ▶ “Application” approach, sections interact and share data (*mashup*)

# Licenza d'uso
