Git & GitHub

QUICK INTRODUCTION

Introduction to Git as a version control system: concepts, main features and practical aspects.

Luigi De Russis and Fulvio Corno

Version Control Systems

Record changes to a file or a set of files over time so that you can recall specific versions later

Three generations:

- 1. Local (RCS, SCCS)
- 2. Centralized (CVS, Subversion, Team Foundation Server)
- 3. Distributed (Git, Mercurial)

NOW

Repository

- place where you store all your work
- contains every version of your work that has ever existed
 - files
 - directories layout
 - history
- can be shared with the whole team

REPOSITORY

Working copy

 \bigtriangleup

WORKING COPY

- a snapshot of the repository used for... working
- the place where changes happens
- private, not shared with the team
- it also contains some metadata so that it can keep track of the state of things
 - has a file been modified?
 - is this file new?
 - has a file been deleted?

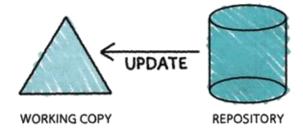

Commit

- the operation that modifies the repository
- atomically performed by modern version control tools
 - the integrity of the repository is ensured
- it is typical to provide a log message (or comment) when you commit
 - to explain the changes you have made
 - the message becomes part of the history of the repository

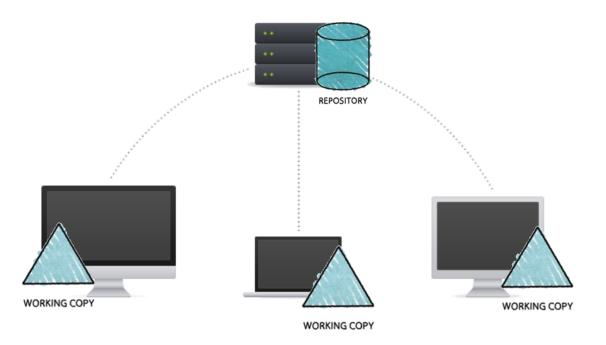

Update

- update the working copy with respect to the repository
 - apply changes from the repository
 - merge such changes with the ones you have made to your working copy, if necessary

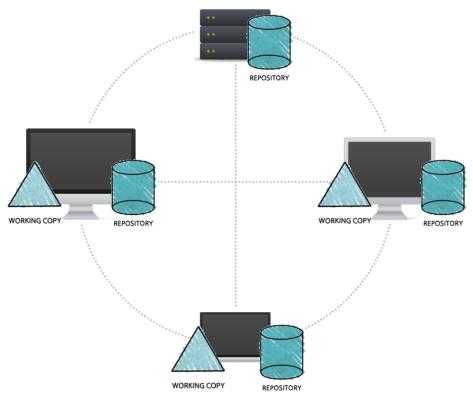

Centralized Version Control

- one central repository
- client-server relationship

Distributed Version Control

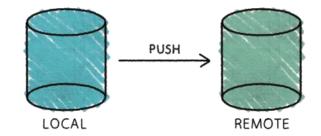

- clients and server have the full copy of the repository
 - local repositories 'clone' a remote repository
- it is possible to have more than one server

More Basic Concepts

Push

 copy changesets from a local repository instance to a remote one

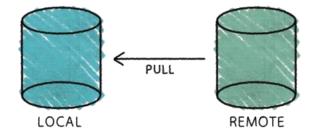

• synchronization between two repository instances

More Basic Concepts

Pull

copy changesets from a remote repository instance to a local one

• synchronization between two repository instances

Introducing... Git

- Distributed Version Control System
- Born
 - on 2005 for the Linux kernel project
 - to be used via command line
- Website: http://git-scm.com
- Highlights:
 - free and open source
 - strong support for non-linear development
 - fully distributed
 - efficient handling of large projects
 - cryptographic authentication of history

Getting started with Git

- Standard installations
 - <u>http://git-scm.com/downloads</u>
- Available for all the platform
- Git Graphical Applications
 - <u>http://git-scm.com/downloads/guis</u>
 - Suggestion: GitExtensions, SourceTree
- For this course, Git is
 - integrated in Eclipse (plugin "EGit")

Installing Git (outside Eclipse)

- Windows
 - download and install Git from http://git-scm.com/downloads
- Linux
 - check if it is already installed
 - open a terminal and type "git"
 - otherwise, install it from your package manager or via <u>http://git-scm.com/downloads</u>
- Mac
 - check if it is already installed
 - open a terminal and type "git"
 - otherwise, install it from http://git-scm.com/downloads

Hosted Git

- To have (at least) one remote repository
 - alternative: set up your own Git server!
- Most popular:
 - GitHub, <u>https://github.com/</u>
 - Bitbucket, <u>https://bitbucket.org/</u>
 - GitLab, <u>https://about.gitlab.com/gitlab-com/</u>
 - Sourceforge, <u>http://sourceforge.net/</u>
 - CodePlex (by Microsoft), <u>https://www.codeplex.com/</u>

GitHub

- Slightly different than other code-hosting sites
 - instead of being primarily based on the project, it is usercentric
 - social coding
- A commercial company
 - charges for accounts that maintain private repository
 - free account to host as many open source project as you want
 - free Micro plan for students
 - 5 private repositories, unlimited public repositories
 - https://education.github.com

Bitbucket

• Similar to GitHub

Bitbucket

- Less used than GitHub, right now
- Mercurial support
- A commercial company
 - free private and public repositories for small team (up to 5 private collaborators)
 - charges for project involving bigger team
 - free for academia (also for students)
 - unlimited public and private repositories
 - unlimited users for single projects

GitHub Pages

- Website for your (GitHub) repository
 - <u>https://pages.github.com/</u>
- FAQ
 - <u>https://help.github.com/categories/github-pages-basics/</u>

For Labs

- Create a personal GitHub account
 - you can also ask for a "student discount" at https://education.github.com
- Try Git!
 - <u>http://try.github.io/</u>
 - 15 minutes tutorial

Workflow 2: "Create new project"

- Create a project in Eclipse (normally)
- Create the local repository in Eclipse (Team|Share)
- Create a new project in GitHub
- Push changes (Team | Commit&push)

New Project on GitHub

Re	posi	tories (+ New repository

Create a new repository

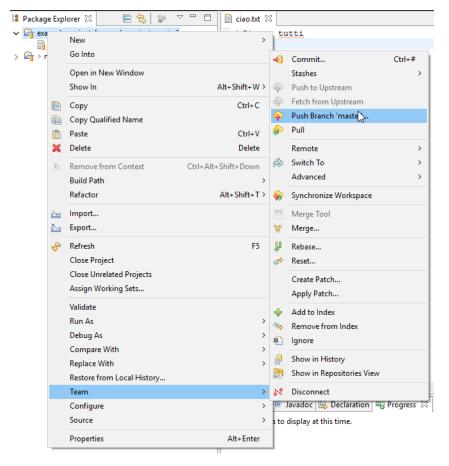

A repository contains all the files for your project, including the revision history.

饕 TdP-2016	▼ /						
Great repository	Great repository names are short and memorable. Need inspiration? How about curly-pancake.

Workflow 1: "Work on a project"

- Fork the project in GitHub (you make a copy in your repository)
- Clone your project in Eclipse
- Work on the project
- Commit and Push the changes

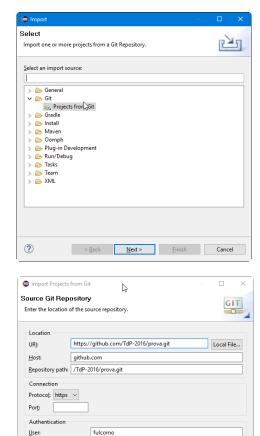

Forking

- "Fork" makes a private copy of some else's repository
- You may clone, work, and commit on this repository

Tags and Branches in a Nutshell

- Local and remote
- Do not push automatically

[Image from http://nvie.com/posts/a-successful-git-branching-model/]

Branches... in brief

- used to develop features isolated from each other
- the master branch is the "default" branch when you create a repository
 - you should use other branches for development and merge them back to the master branch upon completion
- really lightweight in Git
- commands:
 - git branch [branch-name], create a new branch
 - git branch, lists all existing branches
 - git checkout [branch-name], switches to the selected branch
 - git branch -d [branch-name], removes the selected branch

Tags... in brief

- useful to mark release points
- two types:
 - lightweight
 - annotated (more complete)
- commands:
 - git tag, shows the available existing tags
 - git tag [tag-name], creates a lightweight tag
 - git tag -a [tag-name] -m [message], creates an annotated tag
 - tag show [tag-name], shows the tag data
